VAPOR PRESSURE
Variation with Temperature

The following table gives the value of the constants a and b in the following equation:

$$\log_{10} p = -\frac{0.05223a}{T} + b$$

where p is the pressure in mm of mercury of the saturated vapor at the absolute temperature T. ($T = t°C + 273.1$). The values obtained by the use of the equation given above are valid within the temperature ranges indicated for each of the compounds.

Elements and Inorganic Compounds

Compound	Formula	Temp. range °C	a	b
Aluminum oxide	Al_2O_3	1840 to 2200 liq.	540,000	14.22
Ammonia	NH_3	−127 to −78 sol.	31,211	9.9974
Ammonium bromide	NH_4Br	250 to 400 sol.	90,208	9.9404
Ammonium chloride	NH_4Cl	100 to 400 sol.	83,486	10.0164
Ammonium cyanide	NH_4CN	7 to 17 sol.	41,484	9.978
Ammonium iodide	NH_4I	300 to 400 sol.	95,730	10,2700
Ammonium sulfhydrate	NH_4HS	6 to 40 sol.	46,025	10.7500
Antimony	Sb	1070 to 1325 liq.	189,000	9.051
Argon	A	−208 to −189 sol.	7,814.5	7.5741
		−189 to −183 liq.	6,826.0	6.9605
Arsenic	As	800 to 860 liq.	47,100	6.692
		440 to 815 sol.	133,000	10.800
Arsenous oxide	As_2O_3	100 to 310 sol.	111,350	12.127
		315 to 490 liq.	52,120	6.513
Barium	Ba	930 to 1130 liq.	350,000	15.765
Bismuth	Bi	1210 to 1420 liq.	200,000	8.876
Bismuth trichloride	$BiCl_3$	91 to 213 sol.	13,125	2.681
Cadmium	Cd	150 to 320.9 sol.	109,000	8.564
		500 to 840 liq.	99,900	7.897
Cadmium iodide	CdI_2	385 to 450 liq.	122,200	9.269
Cesium	Cs	200 to 350 liq	73,400	6.949
Cesium chloride	CsCl	986 to 1295 liq	163,200	8.340

VAPOR PRESSURE (Continued)

Compound	Formula	Temp. range °C	a	b
Calcium	Ca	960 to 1110 liq.	370,000	16.240
Carbon	C	3880 to 4430 liq.	540,000*	9.596*
Carbon dioxide	CO_2	−135 to −56.7 sol.	26,179.3	9.9082
Carbon monoxide	CO	−220 to −206 liq.	6,354	6.976
Chlorine	Cl	−154 to −103 sol.	29,293	9.950
Cobalt	Co	2375 liq.	309,000	7.571
Copper	Cu	2100 to 2310 liq.	468,000	12.344
Cuprous chloride	Cu_2Cl_2	878 to 1369 liq.	80,700	5.454
Cyanogen	$(CN)_2$	−72 to −28 sol.	32,437	9.6539
		−32 to −6 liq.	23,750	7.808
Ferrous chloride	$FeCl_2$	700 to 930 sol.	135,200	8.33
Gold	Au	2315 to 2500 liq.	385,000	9.853
Hydriodic acid	HI	−97 to −51 sol.	24,160	8.259
		−50 to −34 liq.	21,580	7.630
Hydrobromic acid	HBr	−114 to −86 sol.	22,420	8.734
		−86 to −66 liq.	17,960	7.427
Hydrochloric acid	HCl	−158 to −110 sol.	19,588	8.4430
Hydrocyanic acid	HCN	−8 to +27 liq.	27,830	7.7446
Hydrofluoric acid	HF	−83 to +48 liq.	25,180	7.370
Hydrogen peroxide	H_2O_2	10 to 90 liq.	48,530	8.853
Hydrogen sulfide	H_2S	−110 to −83 sol.	20,690	7.880
Iron	Fe	2220 to 2450 liq.	309,000	7.482
Krypton	Kr	−189 to −169 sol.	10,065	7.1770
		−169 to −150 liq.	9,377.0	6.92387
Lead	Pb	525 to 1325 liq.	188,500	7.827
Lead bromide	$PbBr_2$	735 to 918 liq.	118,000	8.064
Lead chloride	$PbCl_2$	500 to 950 liq.	141,900	8.961
Lithium bromide	LiBr	1010 to 1265 liq.	152,700	8.068
Lithium chloride	LiCl	1045 to 1325 liq.	155,900	7.939
Lithium fluoride	LiF	1398 to 1666 liq.	218,400	8.753
Lithium iodide	LiI	940 to 1140 liq.	143,600	8.011
Magnesium	Mg	900 to 1070 liq.	260,000	12.993
Manganese	Mn	1510 to 1900 liq.	267,000	9.300
Mercuric bromide	$HgBr_2$	111 to 235 sol.	79,800	10.181
		238 to 331 liq.	61,250	8.284
Mercuric chloride	$HgCl_2$	60 to 130 sol.	85,030	10.888
		130 to 270 sol.	78,850	10.094
		275 to 309 liq.	61,020	8.409
Mercuric iodide	HgI_2	100 to 250 sol.	82,340	10.057
		266 to 360 liq.	62,770	8.115
Mercury	Hg	−80 to −38.87 sol.	73,000	10.383
		400 to 1300 liq	58,700	7.752
Molybdenum	Mo	1800 to 2240 sol.	680,000	10 844
Nitrogen	N_2	−215 to −210 sol.	6,881.3	7 66558
Nitrogen dioxide	NO	−200 to −161 sol.	16,423	10 048

Potassium fluoride	KF	1278 to 1500 liq.	207,500	9 000
Potassium hydroxide	KOH	1170 to 1327 liq.	136,000	7 330
Potassium iodide	KI	843 to 1028 liq.	157,600	8 0957
		1063 to 1333 liq.	155,700	7 949
Rubidium	Rb	250 to 370 liq.	76,000	6.976
Rubidium chloride	RbCl	1142 to 1395 liq.	198,600	9.111
Silicon	Si	1200 to 1320 sol.	170,000	5.950
Silicon dioxide	SiO_2	1860 to 2230 liq.	506,000	13.43
Silver	Ag	1650 to 1950 liq.	250,000	8.762
Silver chloride	AgCl	1255 to 1442 liq.	185,500	8.179
Sodium	Na	180 to 883 liq.	103,300	7.553
Sodium bromide	NaBr	1138 to 1394 liq.	161,600	7 948
Sodium chloride	NaCl	976 to 1155 liq.	180,300	8 3297
		1156 to 1430 liq.	185,800	8.548
Sodium cyanide	NaCN	800 to 1360 liq.	155,520	7.472
Sodium fluoride	NaF	1562 to 1701 liq.	218,200	8.640
Sodium hydroxide	NaOH	1010 to 1402 liq.	132,000	7.030
Sodium iodide	NaI	1063 to 1307 liq.	165,100	8.371
Stannic chloride	$SnCl_4$	−52 to −38 sol.	46,740	9.824
Strontium	Sr	940 to 1140 liq.	360,000	16.056
Sulfur dioxide	SO_2	−95 to −75 sol.	35,827	10.5916
Sulfur trioxide	SO_3	24 to 48 liq.	43,450	10.022
Thallium	Tl	950 to 1200 liq.	120,000	6 140
Thallium chloride	TlCl	665 to 807 liq.	105,200	7.974
Tin	Sn	1950 to 2270 liq.	328,000	9.643
Tungsten	W	2230 to 2770 sol.	897,000	9.920
Zinc	Zn	250 to 419.4 sol.	133,000	9.200
		600 to 985 liq.	118,000	8.108

* Based on boiling point of 3927° C or 4200° absolute.

Organic Compounds

Acetaldehyde	C_2H_4O	−24.3 to +27.5 liq.	27,707	7.8206
Acetic acid	$C_2H_4O_2$	−35 to 10 sol.	41,689	8.502
Acetic anhydride	$C_4H_6O_3$	100 to 140 liq.	45,585	8.688

VAPOR PRESSURE (Continued)

Compound	Formula	Temp. range °C	a	b
Acetylene	C_2H_2	−140 to −82 sol.	21,914	8.933
Aniline	C_6H_7N	145 to185 liq.	45,951.6	8.1278
Anthracene	$C_{14}H_{10}$	100 to 600 sol.	70,390	8.706
		100 to 160 liq.	72,000	8.91
		223 to 342 liq.	59,219	7.910
Anthraquinone	$C_{14}H_8O_2$	224 to 286 sol.	110,040	12.305
Benzene	C_6H_6	−58 to −30 sol.	42,904	9.556
		−30 to +5 sol.	44,222	9.846
		0 to 42 liq.	34,172	7.9622
		42 to 100 liq.	32,295	7.6546
Benzoic acid	$C_7H_6O_2$	60 to 110 sol.	63,820	9.033
Benzophenone	$C_{13}H_{10}O$	260 to 308 liq.	58,221	8.137
Benzoyl chloride	C_7H_5ClO	140 to 200 liq.	45,416	7.9245
Benzyl alcohol	C_7H_8O	100 to 135 liq.	59,491	9.5152
		135 to 205 liq.	53,118	8.6977
Butane	C_4H_{10}	−100 to +12 liq.	23,450	7.395
iso-Butane	C_4H_{10}	−115 to −34 liq.	21,273	7.25
n-Butyl alcohol	$C_4H_{10}O$	75 to 117.5 liq.	46,774	9.1362
Butyric acid	$C_4H_8O_2$	80 to 165 liq.	51,103	9.010
Bromobenzene	C_6H_5Br	−26 to −15 liq.	42,500	8.075
p-Bromochlorobenzene	C_6H_4BrCl	23 to 63 sol.	69,755	11.629
Camphor	$C_{10}H_{16}O$	0 to 180 sol.	53,559	8.799
Carbon tetrachloride	CCl_4	−70 to −50 sol.	34,608	8.05
		−19 to +20 liq.	33,914	8.004
Chlorobenzene	C_6H_5Cl	−35 to −15 liq.	42,250	8.500
Cyclohexane	C_6H_{12}	−5 to +5 sol.	37,394	8.594
p-Dichlorobenzene	$C_6H_4Cl_2$	30 to 50 sol.	72,218	12.480
Dichloroethane-1,1	$C_2H_4Cl_2$	0 to 30 liq.	31,706	7.909
Dichloroethane-1,2	$C_2H_4Cl_2$	0 to 30 liq.	35,598	8.126
Diphenylamine	$C_{12}H_{11}N$	278 to 284 liq.	57,350	8.088
Ethyl chloride	C_2H_5Cl	−30 to +30 liq.	26,319	7.691
Ethylene	C_2H_4	−160 to −104 liq.	14,396	7.330
Ethylene bromide	$C_2H_4Br_2$	10 to 150 liq.	38,082	7.792
Heptane	C_7H_{16}	−63 to −40 liq.	37,358	8.2585
Hexane	C_6H_{14}	−10 to +90 liq.	31,679	7.724
Iodobenzene	C_6H_5I	−30 to +18 liq.	43,000	7.500
Methane	CH_4	−194 to −184 sol.	9,896.2	7.6509
		−174 to −163 liq.	8,516.9	6.8626
Methyl alcohol	CH_4O	−62 to −44 liq.	39,234	8.9547
		−10 to +80 liq.	38,324	8.8017
Methyl chloride	CH_3Cl	−47 to −10 liq.	21,988	7.481
Methyl ether	C_2H_6O	−70 to −20 liq.	23,025	7.720
Methyl fluoride	CH_3F	−102 to −76 liq.	17,053	7.445
Methyl salicylate	$C_8H_8O_3$	175 to 215 liq.	48,670	8.008
Naphthalene	$C_{10}H_8$	0 to 80 sol.	71,401	11.450
		120 to 200 liq.	47,362	7.927
o-Nitroaniline	$C_6H_6N_2O_2$	150 to 260 liq.	63,881	8.8684
m-Nitroaniline	$C_6H_6N_2O_2$	170 to 260 liq.	65,880	8.8188
p-Nitroaniline	$C_6H_6N_2O_2$	190 to 260 liq.	77,345	9.5595
Nitrobenzene	$C_6H_5NO_2$	112 to 209 liq.	48,955	8.192
Nitromethane	CH_3NO_2	47 to 100 liq.	36,914	8.033
Oxalic acid	$C_2H_2O_4$	55 to 105 sol.	90,502.6	12.2229
n-Pentane	C_5H_{12}	−20 to +50 liq.	27,691	7.558
Phenol	C_6H_6O	116 to 180 liq.	49,644	8.587
Phthalic anhydride	$C_8H_4O_3$	160 to 285 liq.	54,920	8.022
Propane	C_3H_8	−136 to −40 liq.	19,037	7.217
Propionic acid	$C_3H_6O_2$	20 to 140 liq.	46,150	8.715
n-Propyl alcohol	C_3H_8O	−45 to −10 liq.	47,274	9.5180
Propyl bromide	C_3H_7Br	0 to 30 liq.	32,430	7.821
Propyl chloride	C_3H_7Cl	0 to 50 liq.	28,894	7.593
Propylene	C_3H_6	−95 to −48 liq.	19,693	7.4463
Quinoline	C_9H_7N	180 to 240 liq.	49,720	7.969

VAPOR PRESSURE OF THE ELEMENTS

Rudolf Loebel

This table lists the temperature in degrees Celsius at which an element has a vapor pressure indicated by the headings of the columns. For pressures of one atmosphere and lower, the pressures are given in millimeters of mercury; for pressures above one atmosphere, the pressures are given in atmospheres.

Element		mm Hg					atm.				
		1	10	100	400	760	2	5	10	20	40

CONCENTRATIVE PROPERTIES OF AQUEOUS SOLUTIONS: CONVERSION TABLES

A. V. Wolf and Morden G. Brown

The table columns are:

$A\%$ = anhydrous compound weight percent, e.g., grams solute per 100 grams solution.
$H\%$ = hydrated compound weight percent.
D_{20}^{20} = specific gravity of solution at 20°C.
C_s = anhydrous solute concentration, grams/liter.
M = molar concentration, gram-mols/liter.
C_w = total water concentration, grams/liter.
$C_0 - C_w$ = water displaced by anhydrous solute, grams/liter.
$(n - n_0) \times 10^4$ = index of refraction increment above index of refraction of pure water $\times$ 10^4; "refraction."
n = index of refraction at 20°C. relative to air for sodium yellow light.
Δ = freezing point depression, °C.
S = osmosity, molar concentration of NaCl with same freezing point or osmotic pressure as solution.

Some related measures are:

Density, kg/1 = $.99823 \times D_{20}^{20} = D_4^{20}$
$(C_s + C_w)/1000$ = Density, kg/1
Molality, g-mol/(kg water), = $1000 \times M/C_w$
Osmolality = $\Delta/1.86$
Concentration relative to water, g/(kg water) = $1000 \times C_s/C_w$

Relative specific refractivity = contribution of unit weight of solute relative to unit weight of water to the imaginary concentration of water with same refractive index as solution, equivalent concentration of water = $3694.1788 \times n - 300 \times n^2 - 3394.1788$. The refractive index for this equation is relative to a vacuum whereas the tabulated values are relative to air.

The above equation for the equivalent concentration of water was found to provide better constancy of relative specific refractivity than the equation from the Lorentz and Lorenz relation, $ECW = 4848.3431 - 14545.029/(n^2 + 2)$.

References of data sources at end of each table are respectively for specific gravity, index of refraction and freezing point depression. Letters indicate:

Notes: TS = Total solids, Pr = Protein, NPr = Non-protein solids. Protein concentrations have been determined as differences between nonprotein solids and total solids. These protein concentrations are consistent with a Pr/N ratio of 6.54 rather than the conventional 6.25.

H W C

SPECIFIC GRAVITY OF AQUEOUS INVERT SUGAR SOLUTIONS

t = 20 C

Invert sugar is the equimolar mixture of fructose and glucose obtained by hydrolyzing sucrose.

HEAT OF COMBUSTION

For Organic Compounds

The heat of combustion is given in kilogram calories per gram molecular weight of the substance when combustion takes place at atmospheric pressure and 20° C. The final products of combustion are gaseous carbon dioxide, liquid water and nitrogen gas for C, H, N compounds. For method of computing heats of formation see statement following this table.

Name	Formula	Physical state	Heat of combustion, kg. calories
Acetaldehyde	CH_3CHO	liquid	279.0
Acetamide	CH_3CONH_2	solid	282.6
Acetanilide	$CH_3CONHC_6H_5$	solid	1,010.4
Acetic acid	CH_3CO_2H	liquid	209.4
Acetic anhydride	$(CH_3CO)_2O$	liquid	431.9
Acetone	$(CH_3)_2CO$	liquid	426.8
Acetonitrile	CH_3CN	liquid	302.4
Acetophenone	$C_6H_5COCH_3$	solid	988.9
Acetylacetone	$CH_3COCH_2COCH_3$	liquid	615.9
Acetylene	$(CH)_2$	gas	312.0
Acrolein	$CH_2{:}CHCHO$	liquid	389.6
Acrylic acid	$CH_2{:}CHCO_2H$	liquid	327.5
Adipic acid	$(CH_2)_4(CO_2H)_2$	solid	669.0
Alanine	$CH_3CH(NH_2)CO_2H$	solid	387.7
Aldol, *see β-hydroxybutyr-aldehyde*			
Alizarin, *see Dihydroxyanthraquinone*			
Allyl alcohol	$CH_2{:}CHCH_2OH$	liquid	442.4
Allylene	$CH_3C{:}CH$	gas	465.1
p-Aminoazobenzene	$H_2NC_6H_4N_2C_6H_5$	solid	1,574.0
p-Aminophenol	$HOC_6H_4NH_2$	solid	760.0
Amygdalin	$C_{20}H_{27}O_{11}N$	solid	2,348.4
Amyl acetate	$C_4H_9CO_2C_2H_5$	liquid	1,042.5
Amyl alcohol (ferm.)	$(CH_3)_2CH_2CH_2CH_2OH$	liquid	793.7
Amylene	C_5H_{10}	liquid	803.4
Anethole	$C_{10}H_{12}O$	solid	1,324.4
Aniline	$C_6H_5NH_2$	liquid	811.7
p-Anisidine	$CH_3OC_6H_4NH_2$	solid	924.0
Anisole	$C_6H_5OCH_3$	liquid	905.1
Anthracene	$C_6H_4{:}(CH)_2{:}C_6H_4$	solid	1,700.4
Anthraquinone	$C_{14}H_8O_2$	solid	1,544.5
Arabinose	$C_5H_{10}O_5$	solid	559.9
Arabitol	$C_5H_{12}O_5$	solid	661.2
Arachidic acid	$C_{20}H_{40}O_2$	solid	3,025.9
Azelaic acid	$(CH_2)_7(CO_2H)_2$	solid	1,141.7
Azobenzene	$(C_6H_5N)_2$	solid	1,545.9
Azoxybenzene	$(C_6H_5N)_2O$	solid	1,534.5
Behenic acid	$C_{22}H_{44}O_2$	solid	3,338.4
Benzalacetone	$C_6H_5CH{:}CHCOCH_3$	solid	1,257.4
Benzaldehyde	C_6H_5CHO	liquid	841.3
Benzamide	$C_6H_5CONH_2$	solid	847.6
Benzanilide	$C_6H_5CONHC_6H_5$	solid	1,575.5
Benzene	C_6H_6	liquid	782.3
Benzenediazonium nitrate	$C_6H_5N_2NO_3$	solid	782.6
Benzidine	$(C_6H_4NH_2)_2$	solid	1,560.9
Benzil	$(C_6H_5CO)_2$	solid	1,624.6
* Benzoic acid	$C_6H_5CO_2H$	solid	771.2
Benzoic anhydride	$(C_6H_5CO)_2O$	solid	1,555.1
Benzoin	$C_6H_5.CHOH.COC_6H_5$	solid	1,671.4
Benzonitrile	C_6H_5CN	liquid	865.5
Benzophenone	$(C_6H_5)_2CO$	solid	1,556.5
Benzoyl chloride	C_6H_5COCl	liquid	782.8
Benzoyl peroxide	$(C_6H_5CO)_2O_2$	solid	1,551.7
Benzyl alcohol	$C_6H_5CH_2OH$	liquid	894.3
Benzylamine	$C_6H_5CH_2NH_2$	liquid	969.4
Benzyl carbylamine	$C_6H_5CH_2NC$	liquid	1,046.5
Benzyl chloride	$C_6H_5CH_2Cl$	liquid	886.4
Benzyl cyanide	$C_6H_5CH_2CN$	liquid	1,023.5
Borneol	$C_{10}H_{18}O$	liquid	1,469.6
Brucine	$C_{23}H_{26}O_4N_2$	solid	2,933.0
n-Butyl alcohol	C_4H_9OH	liquid	638.6
tert.-Butyl alcohol, see *Trimethyl carbinol*			
n-Butylamine	$C_4H_9NH_2$	liquid	710.6
sec.-Butylamine	$(CH_3)(C_2H_5){:}CHNH_2$	liquid	713.0
tert.-Butylamine	$(CH_3)_3CNH_2$	liquid	716.0
tert.-Butylbenzene	$C_6H_5C(CH_3)_3$	liquid	1,400.4
n-Butyramide	$C_3H_7CONH_2$	solid	596.0
n-Butyric acid	$C_3H_7CO_2H$	liquid	524.3
n-Butyronitrile	C_3H_7CN	liquid	613.3
Caffeine	$C_8H_{10}O_2N_4$	solid	1,014.2
Camphene	$C_{10}H_{16}$	solid	1,468.8
Camphor	$C_{10}H_{16}O$	solid	1,411.0
Cane sugar, *see Sucrose*			
Capric acid	$C_9H_{19}O_2$	solid	1,458.1
Caproic acid	$C_5H_{11}CO_2H$	liquid	831.0
Carbon disulfide	CS_2	liquid	246.6
Carbon subnitride	$(C.CN)_2$	solid	514.8
Carbon tetrachloride	CCl_4	liquid	37.3
Carbonyl sulfide	COS	gas	130.5
Carvacrol	$C_{10}H_{14}O$	liquid	1,354.5
Cetyl alcohol	$C_{16}H_{34}O$	solid	2,504.4
Cetyl palmitate	$C_{32}H_{64}O_2$	solid	4,872.8
Chloracetic acid	$ClCH_2CO_2H$	solid	171.0
o-Chlorobenzoic acid	$ClC_6H_4CO_2H$	solid	734.5
Chloroform	$CHCl_3$	liquid	89.2
Chrysene	$C_{14}H_{10}$	solid	2,139.1
Cinnamic acid (*trans*)	$C_6H_5CH{:}CHCO_2H$	solid	1,040.2
Cinnamic aldehyde	$C_6H_5CH{:}CHCHO$	liquid	1,112.3

* Accepted value by Int. Union of Pure and Appld. Chem., Lyons, 1923.

HEAT OF COMBUSTION (Continued)

For Organic Compounds

Name	Formula	Physical state	Heat of combustion, kg. calories
Cinnamic anhydride	$C_{18}H_{14}O_3$	solid	2,091.3

Tetraphenylmethane	$(C_6H_5)_4C$	solid	3,102.4
Tetryl	$C_7H_5N_5O_8$	solid	842.3
Thebaine	$C_{19}H_{21}O_3N$	solid	2,441.3
Thiophene	C_4H_4S	liquid	670.5
Thujane	$C_{10}H_{18}$	liquid	1,506.4
Thymol	$C_{10}H_{14}O$	liquid	1,353.4
Thymol	$C_{10}H_{14}O$	solid	1,349.7
Thymoquinone	$C_{10}H_{12}O_2$	solid	1,271.3
Toluene	$CH_3C_6H_5$	liquid	934.2
o-Toluic acid	$CH_3C_6H_4CO_2H$	solid	928.9

* Recommended as a secondary thermochemical standard.

HEAT OF COMBUSTION (Continued)

For Organic Compounds

Name	Formula	Physical state	Heat of combustion, kg. calories
m-Toluic acid	$CH_3C_6H_4CO_2H$	solid	928.6
p-Toluic acid	$CH_3C_6H_4CO_2H$	solid	926.9
o-Toluidine	$CH_3C_6H_4NH_2$	liquid	964.3
m-Toluidine	$CH_3C_6H_4NH_2$	liquid	965.3
p-Toluidine	$CH_3C_6H_4NH_2$	solid	958.4
o-Tolunitrile	$CH_3C_6H_4CN$	liquid	1,030.3
Toluquinone	$C_7H_6O_2$	solid	803.2
Triaminotriphenyl carbinol	$(C_6H_4NH_2)_3COH$	solid	2,483.5
Tribenzyl amine	$(C_6H_5CH_2)_3N$	solid	2,762.1
Trichloracetic acid	$Cl_3C.CO_2H$	solid	92.8
Triethyl amine	$(C_2H_5)_3N$	liquid	1,036.8
Triethyl carbinol	$(C_2H_5)_3CHOH$	liquid	1,080.0
Triisoamyl amine	$[(CH_3)_2CHCH_2CH_2]_3N$	liquid	2,459.3
Triisobutyl amine	$[(CH_3)_2CHCH_2]_3N$	liquid	1,973.6
Trimethyl amine	$(CH_3)_3N$	liquid	578.6
2, 2, 3-Trimethylbutane	$(CH_3)_3C.CH(CH_3)_2$	liquid	1,147.9
Trimethyl carbinol	$(CH_3)_3COH$	liquid	629.3
Trimethylene	$CH_2CH_2CH_2$ (ring)	gas	496.8
Trimethylethylene	$(CH_3)_2C{:}CHCH_3$	liquid	796.0
Trimethylethylene	$(CH_3)_2C{:}CHCH_3$	vapor	803.6
2, 2, 4-Trimethylpentane	$(CH_3)_3C.CH_2CH(CH_3)_2$	liquid	1,303.9
Trinitrobenzene	$C_6H_2(NO_2)_3$—(1, 3, 5)	solid	663.7
Trinitroglycerol	$C_3H_5(NO_3)_3$	liquid	368.4
Trinitrotoluene	$C_6H_2(CH_3)(NO_2)_3$—(1, 2, 4, 6)	solid	820.7
Triphenyl amine	$(C_6H_5)_3N$	solid	2,267.8
Triphenylbenzene	$C_6H_3(C_6H_5)_3$—(1, 3, 5)	solid	2,936.7
Triphenyl carbinol	$(C_6H_5)_3CHOH$	solid	2,340.8
Triphenylmethane	$(C_6H_5)_3CH$	solid	2,388.7
Triphenyl methyl	$(C_6H_5)_3C$	solid	2,378.5
Tyrosine	$C_9H_{11}O_3N$	solid	1,070.2
Undecylic acid	$C_{11}H_{22}O_2$	solid	1,615.9
Urea	$(NH_2)_2CO$	solid	151.6
Urethane	$NH_2CO_2C_2H_5$	solid	397.2
Uric acid	$C_5H_4O_3N_4$	solid	460.2
n-Valeric acid	$C_4H_9CO_2H$	liquid	681.6
Vanillin	$C_6H_3(OH)(OCH_3)CHO$—(1, 2, 4)	solid	914.1
o-Xylene	$(CH_3)_2C_6H_4$	liquid	1,091.7
m-Xylene	$(CH_3)_2C_6H_4$	liquid	1,088.4
p-Xylene	$(CH_3)_2C_6H_4$	liquid	1,089.1
Xylose	$C_5H_{10}O_5$	solid	561.5

HEAT OF FORMATION

For Organic Compounds

The heat of formation of a compound "A" is equal to the sum of the heats of formation of the products of combustion minus the heat of combustion (see preceding table) of the compound "A." The heat of formation of:

Free elements	0	kg-cal
CO_2 (gas)	94.38	"
$\frac{1}{2}H_2O$ (liquid from 1 H)	34.19	"
HF (dilute aqueous solution)	75.6	"
SO_2 (gas)	69.3	"
HBr (aqueous solution)	28.54	"
HCl (aqueous solution)	39.46	"
HNO_3 (aqueous solution)	49.80	"
H_2SO_4 (aqueous solution)	207.5	"

Example I

To calculate the heat of formation of methane (CH_4) where

Heat of combustion of methane = 210.8
Heat of formation of CO_2 = 94.38
Heat of formation of $\frac{1}{2}H_2O$ = 34.19

and where the combustion occurs according to the equation:

$$CH_4 + 2O_2 = CO_2 \text{ (gas)} + 2H_2O \text{ (liquid)}$$

Then the heat of formation of $CH_4 = 94.38 + 4(34.19) - 210.8 = +20.34$ kg-cal. per gram molecular weight.

Example II

To calculate the heat of formation of ethylene (C_2H_4) where

Heat of combustion of ethylene = 331.6

and the combustion occurs according to the equation:

$$C_2H_4 + 3O_2 = 2CO_2 + 2H_2O$$

The heat of formation of $C_2H_4 = 2(94.38) + 4(34.19) - 331.6 = -6.08$ kg-cal. per gram molecular weight.

Example III

To calculate the heat of formation of ethylamine ($C_2H_5NH_2$) where

Heat of combustion of ethylamine = 408.5

and the combustion occurs according to the equation:

$$C_2H_5NH_2 + 3.75O_2 = 2CO_2 + 3.5(H_2O) + 0.5N_2$$

The heat of formation of $C_2H_5NH_2 = 2(94.38) + 7(34.19) + O(N_2) - 408.5 = +19.59$ kg-cal. per gram molecular weight.

FATS AND OILS

These data for fats and oils were compiled originally for the Biology Data Book by H. J. Harwood, and R. P. Geyer. 1964. Data are reproduced here by permission of the copyright owners of the above publication, the Federation of American Societies for Experimental Biology, Washington, D.C. pp. 380–382.

Values are typical rather than average, and frequently were derived from specific analyses for particular samples (especially the constituent fatty acids). Extreme variations may occur, depending on a number

	Fat or Oil	Source	Constants

LOWERING OF VAPOR PRESSURE BY SALTS IN AQUEOUS SOLUTIONS

The table gives the reduction of the vapor pressure in millimeters due to the presence of the number of grammolecules of salt per liter of water given at the head of the columns, at the temperature 100° C, at which temperature the vapor pressure of pure water is 760 millimeters.

THERMAL CONDUCTIVITY OF GASES

The values in this table are given as cal/(sec)(cm²)(°C/cm) × 10^{-6}. To convert these values to Btu/(hr) (ft²) (°F/ft) × 10^{-6} multiply by 241.909.

Gas	°F °C	−400 −240	−300 −184.4	−200 −128.9	−100 −73.3	−40 −40	−20 −28.9	0 −17.8	20 −6.7	40 4.4	60 15.6	80 26.7	100 37.8	120 48.9	200 93.3

THERMAL CONDUCTIVITY OF GASEOUS HELIUM, NITROGEN AND WATER

From NSRDS-NBS 8

R. W. Powell, C. Y. Ho, and P. E. Liley

The thermal conductivity, k, is given in the units Milliwatt cm^{-1} $°K^{-1}$. To convert to Cal(*gm*) hr^{-1} cm^{-1} $°K^{-1}$ multiply the values listed in the table by 0.860421

	k			k				k				k

THERMAL CONDUCTIVITY OF MATERIALS

(Bureau of Standards Letter Circular No. 227)

D = Density in pounds per cubic foot.
K = Thermal conductivity in B.T.U. per hour, square foot, and temperature gradient of 1 degree Fahrenheit per inch thickness. The lower the conductivity, the greater the insulating values.

		D	K
Soft Flexible Materials in Sheet Form			
Dry Zero	Kapok between burlap or paper	1.0	0.24
		2.0	0.25
Cabots Quilt	Eel grass between kraft paper	3.4	0.25
		4.6	0.26
Hair Felt	Felted cattle hair	11.0	0.26
		13.0	0.26
Balsam Wool	Chemically treated wood fibre	2.2	0.27
Hairinsul	75% hair 25% jute	6.3	0.27
	50% hair 50% jute	6.1	0.26
Linofelt	Flax fibres between paper	4.9	0.28
Thermofelt	Jute and asbestos fibres, felted	10.0	0.37
	Hair and asbestos fibres. felted	7.8	0.28
Loose Materials			
Rock Wool	Fibrous material made from rock,	6.0	0.26
	also made in sheet form, felted and	10.0	0.27
	confined with wire netting	14.0	0.28
		18.0	0.29
Glass Wool	Pyrex glass, curled	4.0	0.29
		10.0	0.29
Sil-O-Cel	Powdered diatomaceous earth	10.6	0.31
Regranulated Cork	Fine particles	9.4	0.30
	about 3/16 inch particles	8.1	0.31
Thermofili	Gypsum in powdered form	26.	0.52
		34.	0.60
Sawdust	Various	12.0	0.41
	redwood	10.9	0.42
Shavings	Various, from planer	8.8	0.41
Charcoal	From maple, beech and birch,		
	coarse	13.2	0.36
	6 mesh	15.2	0.37
	20 mesh	19.2	0.39
Semi-flexible Materials in Sheet Form			
Flaxlinum	Flax fibre	13.0	0.31
Fibrofelt	Flax and rye fibre	13.6	0.32
Semi-rigid Materials in Board Form			
Corkboard	No added binder; very low density	5.4	0.25
Corkboard	No added binder; low density	7.0	0.27
Corkboard	No added binder; medium density	10.6	0.30
Corkboard	No added binder; high density	14.0	0.34
Eureka	Corkboard with asphaltic binder	14.5	0.32
Rock Cork	Rock wool block with binder. Also called "Tucork"	14.5	0.326
Lith	Board containing rock wool, flax and straw pulp	14.3	0.40
Stiff Fibrous Materials in Sheet Form			
Insulite	Wood pulp	16.2	0.34
		16.9	0.34
Celotex	Sugar cane fibre	13.2	0.34
		14.8	0.34
*Masonite		K = 0.33	
*Inso-board		0.33	
*Maizewood		0.33 to 0.39	
*Cornstalk Pith Board		0.24 to 0.30	
*Maftex		0.34

PbO (100%)	1	0.38	7.98	1.6	1.25	0.98

[a] Composition: 90% MgO, 10% Al_2O_3 designates weight percent. $Li_2O{:}4B_2O_3$ designates mole composition, does not indicate compound formation.

[b] Classification: 1 = research body; 2 = industrial research body; 3 = commercial body; 4 = natural mineral; 5 = synthetic mineral.

[c] Thermal conductivity: Units in Btu/(hr) (sq ft)(°F/ft); to convert to cal/(sec) (sq cm)(°C/cm) multiply by 0.00413. (I) = determination made with high vacuum apparatus, inconel thermodes. No letters following value, determination made with high vacuum thermal conductivity apparatus, copper thermodes.

THERMAL CONDUCTIVITY OF CERTAIN METALS

From NSRDS-NBS 8
R. W. Powell, C. Y. Ho, and P. E. Liley

The thermal conductivity, k, is given in the units Watt cm^{-1} $°K^{-1}$.
To convert to Cal(*gm*) hr^{-1} cm^{-1} $°C^{-1}$ multiply the values listed in the tables by 860.421.
To convert to Btu hr^{-1} ft^{-1} $°F^{-1}$ multiply the values listed in the tables by 57.818.
ρ_0 is the residual electrical resistivity and the value of ρ at 4.2°K is used approximately as ρ_0.

T,K	Aluminum 99.996+% ρ_0 = 0.00315 μohm cm	Copper 99.999+% ρ_0 = 0.000851 μohm cm	Gold 99.999+% ρ_0 = 0.0055 μohm cm	Iron 99.998+% ρ_0 = 0.0327 μohm cm	Manganin	Platinum 99.999% ρ_0 = 0.0106 μohm cm	Silver 99.999+% ρ_0 = 0.00062 μohm cm	Tungsten 99.99+% ρ_0 = 0.0017 μohm cm

U. S. Inches to Millibars

Based on the relation 1 inch of mercury at 32°F represents a pressure of 33.8639 millibars.

Note:

Figures in last nine columns to be preceded by 7, 8, 9 or 10 as indicated in column 2.

CONVERSION TABLE FOR BAROMETRIC READINGS
(Continued)

Centimeters to Millibars

Based on the relation 1 centimeter of mercury at 0°C represents a pressure of 13.3322 millibars. Note: Figures in last nine columns to be preceded by 9.

TEMPERATURE CORRECTION FOR BAROMETER READINGS

BRASS SCALE—METRIC UNITS

To reduce readings of a mercurial barometer with a brass scale to 0°C subtract the appropriate quantity as found in the table. These values are based on the coefficient of expansion of mercury $(181792 + 0.175t + 0.035116t^2) \times 10^{-9}$, and of brass 0.0000184 per °C. Corrections are in millimeters.

BRASS SCALE—ENGLISH UNITS

Standard Temperature of scale 62° F; of mercury, 32° F. Zero correction at 28.5° F; subtract corrections above, add below. Owing to the difference in the standard temperature of English and metric scales, readings taken in inches to be reduced to centimeters should *first* be corrected for temperature.

EFFICIENCY OF DRYING AGENTS

Compiled by John H. Yoe

A. Drying agents depending upon chemical action (absorption) for their efficiency:*

Substance	Residual water, mg per liter of dry air**	Reference
P_2O_5	<1 mg in 40,000 l,	Morley, Am. J. Sci., **34**, 199 (1887); J.A.C.S., **26**, 1171 (1904).
$Mg(ClO_4)_2$ anhyd.	"Unweighable" in 210 l,	Willard and Smith, J.A.C.S., **44**, 2255 (1922).
BaO	0.00065	Bower, Bur. Std. J. Res., **12**, 241 (1934).
KOH fused	0.002	Baxter and Starkweather, J.A.C.S., **38**, 2038 (1916).
CaO	0.003	Bower, loc. cit.
H_2SO_4	0.003	Baxter and Starkweather, loc. cit.
$CaSO_4$ anhyd.	0.005	Bower, loc. cit.
Al_2O_3	0.005	Ibid.
KOH sticks	0.014	Ibid.
NaOH fused	0.16	Baxter and Starkweather, loc. cit.
$CaBr_2$	0.18	Baxter and Warren, J.A.C.S., **33**, 340 (1911).
$CaCl_2$ fused	0.34	Baxter and Starkweather, loc. cit.
NaOH sticks	0.80	Bower, loc. cit.
$Ba(ClO_4)_2$	0.82	Ibid.
$ZnCl_2$	0.85	Baxter and Warren, loc. cit.
$ZnBr_2$	1.16	Ibid.
$CaCl_2$ granular	1.5	Bower, loc. cit.
$CuSO_4$ anhyd.	2.8	Ibid.

B. Drying agents depending upon physical action (adsorption) for their efficiency:* Alumina (low temperature fired), asbestos, charcoal, clay and porcelain (low temperature fired), glass wool, kieselguhr, silica gel, refrigeration.

* It should be noted that the efficiency of some drying agents (e.g. Al_2O_3 and anhydrous $CaCl_2$, and probably also BaO, anhydrous $Mg(ClO_4)_2$, $Mg(ClO_4)_2 \cdot 3H_2O$, anhydrous $Ba(ClO_4)_2$, and $CaSO_4$) depends upon both adsorption and absorption.

** 30°C. for Bower's values; others 25°C. or room temp.

REDUCTION OF BAROMETER TO SEA LEVEL

The correction to be added to reduce barometric readings to "sea level" values depends principally on three factors: The temperature of the air column (assumed) from the station to sea level, the altitude of the station, and the value of the reading itself. Two tables are provided. Table I is entered with the altitude and assumed temperature and a factor "2000 m" taken out. Table II is entered with the above factor and the approximate barometer reading and the final correction taken out.

The correction is to be added. If B_0 is the corrected or sea level value; B the barometer reading at the station; C the correction,—

$$C = B_0 - B = B\,(10^m - 1)$$

The actual barometer reading at the station should be corrected for temperature of the mercury column by the usual methods before entering the tables or applying the sea level correction.

A complete explanation of the theory of the corrections and a more extended set of tables will be found in the Smithsonian Meteorological Tables.

Latitude Factor

The influence of the latitude on the value of the correction is usually negligible, being overshadowed by uncertainties in the assumed temperature of the air column. For cases where this correction is desirable the table below is provided. The value of the temperature-altitude factor "2000 m" obtained in Table I is corrected for latitude by subtracting for latitudes 0-45° and adding for latitudes from 45-90° the values found. With this corrected value of "2000 m" Table II is entered for the value of the correction.

LATITUDE FACTOR

To be used in connection with Tables I and II, either English or metric units, to obtain latitude corrections to temperature-altitude factor. For latitudes 0-45° subtract the correction. For latitudes 45-90° add the correction.

Temp.—Alt. from Table I	Latitude			
	0°	15°	30°	45°
100	0.3	0.2	0.1	0.0
200	0.5	0.5	0.3	0.0
300	0.8	0.7	0.4	0.0
	90°	75°	60°	45°

METRIC UNITS—TABLE I

Values of the temperature-altitude factor (2000 m.) for entering table II.

Altitude in meters	Assumed temperature of air column °C									
	−16°	−8°	0°	+4°	+8°	+12°	+16°	+20°	+24°	+28°

RELATIVE HUMIDITY FROM WET AND DRY BULB THERMOMETER (CENT. SCALE)

This table gives the approximate relative humidity directly from the reading of the air temperature (dry bulb) (t°C) and the wet bulb (t'°C). It is computed for a barometric pressure of 74.27 cm Hg. Errors resulting from the use of this table for air temperatures above −10°C and between 77.5 and 71 cm Hg will usually be within the errors of observation.

Condensed from Bulletin of the U. S. Weather Bureau No. 1071

REDUCTION OF PSYCHROMETRIC OBSERVATION

For the reduction of observations with the wet and dry bulb thermometer Assuming the relative velocity of the air to the thermometer bulbs is at least three meters per second; if t is the temperature of the air as indicated by the dry bulb, t_w, the temperature of the wet bulb, B, the barometric pressure, and E_w, the vapor tension of water corresponding to t_w, then the actual vapor tension is

$$E = E_w - 0.00066B(t - t_w)(1 + 0.00115t_w)$$

The value of the term

$$0.00066B(t - t_w)(1 + 0.00115t_w)$$

is given in the followirg table.

CONSTANT HUMIDITY WITH SULFURIC ACID SOLUTIONS

The relative humidity and pressure of aqueous vapor of air in equilibrium conditions above aqueous solutions of sulfuric acid are given below.

Density of acid solution	Relative humidity	Vapor pressure at 20°C	Density of acid solution	Relative humidity	Vapor pressure at 20°C
1.00	100.0	17.4	1.30	58.3	10.1
1.05	97.5	17.0	1.35	47.2	8.3
1.10	93.9	16.3	1.40	37.1	6.5
1.15	88.8	15.4	1.50	18.8	3.3
1.20	80.5	14.0	1.60	8.5	1.5
1.25	70.4	12.2	1.70	3.2	0.6

For concentration of sulfuric acid solution refer to tables relating density to percent composition.

VELOCITY OF SOUND

Compiled by Gordon E. Becker, Bell Telephone Laboratories

The data for the Velocity of Sound in Various Materials were compiled from a variety of sources. For more extensive tables one is referred to the following books:

AIP Handbook, Smithsonian Tables.
Mason: Physical Acoustics and the Properties of Solids (1958).
Chalmers and Quarrell: Physical Examination of Metals (1960).
Mason: Piezoelectric Crystals and their Application to Ultrasonics (1950).
Bergmann: Der Ultraschall (Hirzel, 1954).

Definition of Terms: V_l = Velocity of plane longitudinal wave in bulk material
V_s = Velocity of plane transverse (shear) wave
V_{ext} = Velocity of longitudinal wave (extensional wave) in thin rods.

Solids

Substance	Density gm/cc	V_l m/sec	V_s m/sec	V_{ext} m/sec

Sound Absorption

Data in the following tables have been selected from the official Bulletin of the Acoustical Materials Association and are reproduced by permission of the Association.

TABLE I. GENERAL BUILDING MATERIALS AND FURNISHINGS

The following table gives the sound absorption coefficients of various materials. The reverberation time is defined as the time required for the reverberant sound intensity to decrease to one millionth of its initial intensity, or 60 decibels. The time is given in seconds by the relation, $T_r = 0.049 \left(\frac{V}{\alpha}\right)$, where V is the volume of the room in cubic feet and α is the absorption. The absorption α in Sabins is computed by multiplying the area in square feet of each surface by its absorption coefficient and taking the sum of the products. The absorption of seats and audience is also computed on an area basis using the coefficients given below.

Complete tables of coefficients of the various materials that normally constitute the interior finish of rooms may be found in the various books on architectural acoustics. The following short list will be useful in making simple calculations of the reverberation in rooms.

Materials	Coefficients					
	125 cps	250 cps	500 cps	1000 cps	2000 cps	4000 cps
Brick, unglazed	.03	.03	.03	.04	.05	.07
Brick, unglazed, painted	.01	.01	.02	.02	.02	.03
Carpet, heavy, on concrete	.02	.06	.14	.37	.60	.65
Same, on 40 oz. hairfelt or foam rubber	.08	.24	.57	.69	.71	.73
Same, with impermeable latex backing on 40 oz. hairfelt or foam rubber	.08	.27	.39	.34	.48	.63
Concrete Block, coarse	.36	.44	.31	.29	.39	.25

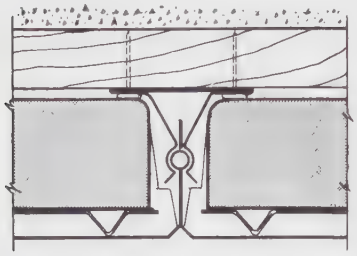
Chairs, metal or wood seats, each, unoccupied	.15	.19	.22	.39	.38	.30

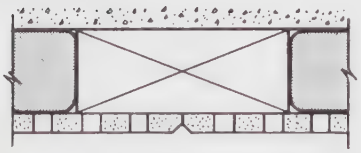
TABLE II. SPECIAL ACOUSTICAL MATERIALS

This table is divided into two parts; one part listing coefficients and the other part listing attenuation factors. *Italicized numbers in that portion of this table concerned with attenuation factors indicate ceiling attenuation greater than that listed;* the actual performance could not be determined because the ceiling-plenum-ceiling-attenuation approached or exceeded that of the partition separating the rooms. This is a result of the partition employed in the tests exceeding in performance most commonly available partitions. Attention is called to the different types of panel mountings which are used during the conduct of these Sound Absorption tests.



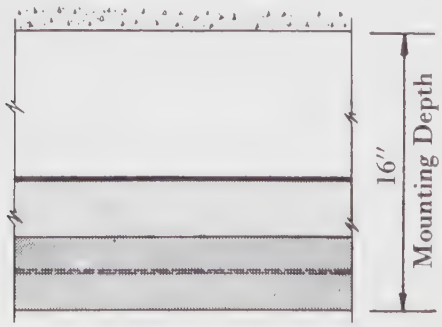
TYPES OF MOUNTING

1. Cemented to plaster board with $\frac{1}{8}''$ air space. Considered equivalent to cementing to plaster or concrete ceiling.

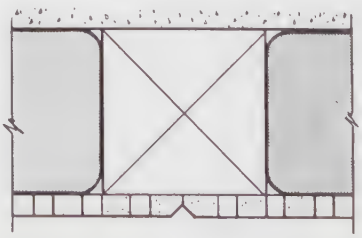


2. Nailed to nominal $1'' \times 3''$ wood furring 12″ o.c. unless otherwise indicated.

3. Attached to metal supports applied to nominal $1'' \times 3''$ wood furring.



4. Applied directly to ceiling or wall.



5. Furred 1″, furring 24″ o.c. 1″ Mineral wool between furring.

6. Attached to 24 ga. sheet iron, supported by metal angles.

7. Mechanically mounted on special metal supports.

8. Furred 2″, furring 24″ o.c. 2″ Mineral wool between furring.

TABLE II. SPECIAL ACOUSTICAL MATERIALS

* The Federal Specification establishes specific criteria by which materials may be classified from "A" to "D," depending on their performance in the test. No specific terms are given to describe these classes but materials classified "A" are usually considered as "incombustible" and those classified "D" as "combustible." Classes "B" and "C" represent materials of intermediate flame resistance.

For the flame resistance tests for which ratings are shown in this bulletin, materials were mounted by bolting them directly to an asbestos cement board panel.

[1] Perforated 484 holes per sq. ft., 3/16″ diameter, 1 7/32″ on centers.

[2] Available either with standard No. 232 two-coat, hot-rolled finish, or with No. 9 flame-resisting factory-applied finish which provides a Class "C" flame resistance rating according to Federal Specification SS-A-118b.

[3] Perforated, enameled metal pan with mineral wool sound-absorbing pad. Perforated in diagonal pattern, 1105 holes per sq. ft., 3/32″ diameter. Flanges and bevels unperforated. Thickness includes tee bar. Also available in standard and random perforating patterns.

[4] Slotted enameled metal units with 1¼″ mineral fiber absorbent pads laminated.

[1] Perforated enameled metal pan with sound-absorptive element as stated under Material. Pan perforated 925 holes per sq. ft., 0.108″ diameter. Thickness includes tee bar.

[2] One half perforated metal pan backed with sound-absorptive element as stated under Material; one half unperforated metal pan unbacked. Thickness includes tee bar. Pan perforated 1625 holes per sq. ft., 0.10″ diameter.

[3] Blanket supported by tee bars about 1½″ above face of metal pan.

[4] Transite perforated 600 holes per sq. ft., 3/16″ diameter.

[5] Perforated 484 holes per sq. ft., 3/16″ diameter.

[6] Perforated 312 holes per sq. ft., 132 of ¼″ and 180 of 3/16″ diameters.

[7] Three dimensional glass fiber lay-in panel, approximately 5/32″ thick, with glass fiber fabric finish available in beige, green and blue.

[8] Acoustical Ceiling Constructions Classified by Underwriters' Laboratories, Incorporated.

No. 4400-1—¾″ Firedike Mineral Tile—Design 29—2 Hours

[9] Perforated 350 hexagonal shaped holes per sq. ft., 86 holes 3/16″ diameter across the flats, and 264 holes 5/32″ diameter across the flats.

CORRECTIONS FOR TEMPERATURE AND PRESSURE

Values found in the above table may be corrected for temperature and pressure by multiplying the values given by the appropriate correction factor found below:

Temp. °C.	Pressure mm 720	740	760	780
0	1.04	1.06	1.09	1.12
10	1.00	1.02	1.05	1.08
20	0.96	0.99	1.02	1.04
30	0.93	0.96	0.98	1.01

DIELECTRIC CONSTANTS

Dielectric Constants of Pure Liquids

The values listed in the following table were obtained from National Bureau of Standards Circular 514

The dielectric constants are intended to be the limiting values at low frequencies, the so-called static values. Temperature is the only variable considered explicitly. Usually pressure is atmospheric or insignificantly different with respect to its effect on the dielectric constant. Where data are listed above the normal boiling point, the pressure corresponds to the vapor pressure of the liquid unless otherwise noted in the footnote.

Symbols

ϵ = dielectric constant ($\epsilon_{vacuum}=1$)
t = temperature, Centigrade (°C)
T = temperature, Absolute (°K)
$a = -d\epsilon/dt$
$\alpha = -d \log_{10} \epsilon/dt$
t_1, t_2 = the limits of temperature between which a or α is considered applicable
mp = melting point
bp = boiling point
f = frequency of alternating current in cycles per second

Standard Liquids

		ϵ_{20}°C	ϵ_{25}°C	a (or α)*
C_6H_{12}	Cyclohexane	2.023	2.015	0.0016
CCl_4	Carbon tetrachloride	2.238	2.228	.0020
C_6H_6	Benzene	2.284	2.274	.0020
C_6H_5Cl	Chlorobenzene	5.708	5.621	.00133(α)
$C_2H_4Cl_2$	1,2-Dichloroethane	10.65	10.36	.00240(α)
CH_4O	Methanol	33.62	32.63	.00260(α)

DIELECTRIC CONSTANTS

Dielectric Constants of Pure Liquids (Continued)

Standard Liquids (Continued)

		ϵ_{20}°C	ϵ_{25}°C	a (or α)*
$C_6H_5NO_2$	Nitrobenzene	35.74	34.82	.00225(α)
H_2O	Water	80.37	78.54	.00200(α)
H_2	Hydrogen	1.228 at 20.4°K		.0034
O_2	Oxygen	1.507 at 80.0°K		.0024

* The values of a or α given in this table are derived from data in the vicinity of room temperature and are not necessarily identical with the values listed in the following sections of this table. They may be used to calculate values of dielectric constant between 15° and 30°C without introducing significant error.

Inorganic Liquids

	Substance	ϵ	t°C	a (or α) $\times 10^2$	Range t_1, t_2

DIELECTRIC CONSTANTS

Table of Dielectric Constants of Reference Gases at 20°C and 1 Atmosphere

The listed values ($\epsilon - 1$) refer to the gas at a temperature of 20°C and pressure of 1 atmosphere. The values can be adjusted to slightly different conditions without introducing more than 0.1% error by use of the following equation:

$$\frac{(\epsilon - 1)_{t,p}}{(\epsilon - 1)_{20°,1\ \text{atm}}} = \frac{p}{760[1 + 0.003411(t - 20)]}$$

where p = pressure in mm Hg
t = degrees C

t should be between 10 and 30°C and p between 700 and 800 mm Hg. From National Bureau of Standards Circular 537

PROPERTIES OF DIELECTRICS

Compiled by Earle C. Gregg, Jr.

In most cases properties have been determined by A S T M (American Society for Testing Materials) test methods at room temperature under standard conditions. Values will in general change considerably with temperature.

Plastics

Material	Dielectric Constant 10^6 Cycles	Dielectric Strength volts/mil	Volume Resistivity Ohms-cm 23°C	Loss Factor*
Allyl resin, cast	3.6–4.5	380	$>4 \times 10^{14}$	0.028–0.06
Aniline formaldehyde resin, no filler	3.5–3.6	600–650	10^{16}–10^{17}	0.006–0.008
Casein	6.1–6.8	400–700	.....	0.052
Cellulose acetate, molding	3.2–7.0	250–365	10^{10}–10^{13}	0.01–1.0
sheet	4.0–5.5	250–300	10^{11}–10^{13}	0.04–0.06
Cellulose acetate butyrate	3.2–6.2	250–400	10^{10}–10^{12}	0.01–0.04
Cellulose nitrate (proxylin)	6.4	300–600	$(10–15) \times 10^{10}$	0.06–0.09
Cold molded compound, inorganic, refractory	.....	45	.....	.....
Cold molded compound, organic non-refractory	6.0	85–115	1.3×10^{12}	0.07
Ethyl cellulose	2.8–3.9	350–500	10^{12}–10^{14}	0.01–0.06
Epoxy cast resin	3.62	400	10^{16}–10^{17}	0.019
Glycerol phthalate, cast, alkyd	3.7–4.0	300–350	$>10^{14}$	0.025–0.035
Melamine formaldehyde resins, molding				
Alpha cellulose filler	7.2–8.2	300–400	$10^{12} \times 10^{14}$	0.027–0.045
Asbestos filler	6.1–6.7	350–400	2.4×10^{11}	0.041–0.050
Cellulose filler	4.7–7.0	350–400	.....	0.032–0.060
Flock filler	.....	300–330	.....	.....
Macerated fabric filler	6.5–6.9	250–350	10^{9}–10^{10}	0.036
Methyl methacrylate, cast	2.7–3.2	450–500	$>10^{15}$	0.02–0.03
molding	2.7–3.2	450–500	$>10^{14}$	0.02–0.03
Mica, glass bonded, compression	7.4–7.85	.....	10^{14}–10^{15}	0.0015–0.002
injection	6.9–9.2	.....	10^{14}–10^{17}	0.0015–0.012
Nylon (F.M. 3001)	3.5	470	4×10^{14}	0.03
Phenol formaldehyde resins, molding				
Asbestos filler	5.0–7.0	100–350	10^{10}–10^{12}	0.10–0.50
Glass fiber	6.6	140–370	7×10^{12}	0.02
Mica filler	4.2–5.2	300–460	10^{12}–10^{14}	0.005–0.04
No filler	4.5–5.0	300–400	10^{11}–10^{12}	0.015–0.03
Sisal felt	3–5	250–400	10^{11}–10^{12}	0.3–0.5
Wood flour filler	4.–7.	200–425	10^{9}–10^{13}	0.03–0.07
Phenol formaldehyde resins, cast				
Mineral filler	9–15	100–250	10^{9}–10^{12}	0.07–0.2
No filler	4.0–5.5	350–400	10^{12}–10^{13}	0.04–0.05
Polyacrylic ester (filled and vulcanized)	.....	400–700	2×10^{11} at 70°C	.....
Polyester, cast resin, rigid	2.8–4.1	380–500	10^{14}	0.006–0.026
flexible	4.1–5.2	250–500	.....	0.023–0.052
Polyester molding materials, (glass fiber filler)	4.0–4.5	150–400	10^{12}–10^{14}	0.015–0.020
Polyethylene	2.3	460	1.6×10^{12}	<0.0005
Polymonochlorodifluoroethylene	2.5	400	1.2×10^{18}	0.010
Polystyrene molding	2.4–2.65	500–700	10^{17}–10^{19}	0.0001–0.0004
Polytetrafluoroethylene	2.0	480	$>10^{15}$	<0.0002–0.0005
Rubber, hard	2.8	470	2×10^{15}	0.06
chlorinated	3 approx.	.....	1.5×10^{13}	0.006
modified, isomerized	2.4–2.7	620	5×10^{16}	0.0008–0.002
Shellac	.....	200–600	1.8×10^{9}	.....
Silicone molding compound (glass fiber filled)	3.7	185	$10^{11} \times 10^{13}$	0.0017
Styrene, modified, molding (shock resistant type)	2.4–3.8	300–600	10^{12}–10^{17}	0.0004–0.02
Urea formaldehyde resin, alpha cellulose filler	6.4–6.9	300–400	10^{12}–10^{13}	0.028–0.032

Selected Values of Electric Dipole Moments for Molecules in the Gas Phase

Ralph D. Nelson, Jr., David R. Lide, Jr., and Arthur A. Maryott

The following table was abstracted from the publication, "Selected Values of Electric Dipole Moments for Molecules in the Gas Phase" compiled by Nelson, Lide and Maryott and published as part of the National Reference Data Series—National Bureau of Standards (NSRDS—NBS 10). The publication is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402. Those desiring a complete listing of all compounds in the NSRDS—NBS 10, discussion of the bibliographic procedure and the principal methods of dipole moment measurement should obtain the publication.

Values of the dipole moment, μ, are expressed in the cgs system of units, since this is the system universally used by workers in the field. The numerical values are in debye units, D, ($1\ D = 10^{-18}$ electrostatic units of charge$\times$centimeters). The conversion factor to the Système International is $1\ D = 3.33564 \times 10^{-24}$ coulomb-meter.

Code symbol	Estimated accuracy of value
A	$\pm$ 1% or, for $\mu < 1.0$ D, $\pm$ 0.01 D
B	$\pm$ 2% or, for $\mu < 1.0$ D, $\pm$ 0.02 D
C	$\pm$ 5% or, for $\mu < 1.0$ D, $\pm$ 0.05 D
S	$\mu \equiv 0$ on grounds of molecular symmetry

Code symbol	Estimated accuracy of value
i	The significance of these values may involve some ambiguity because of the possibility of different conformations or spatial isomers.

Compounds not containing carbon

Formula	Compound name	Selected moment (debyes)	
AgCl	Silver chloride	5.73	C
$AsCl_3$	Arsenic trichloride	1.59	C
AsF_3	Arsenic trifluoride	2.59	B
AsH_3	Arsine	0.20	C
BCl_3	Boron trichloride	0	S
BF_3	Boron trifluoride	0	S

C_9H_7N	Isoquinoline	2.73	C
$C_9H_{10}O_2$	Ethyl phenylformate (ethyl benzoate)	2.00	Ci
$C_{10}H_8$	Azulene	0.80	B
$C_{10}H_{14}BeO_4$	Bis(2,4-pentanedionato) beryllium	0	S
$C_{12}H_9BrO$	*p*-Bromophenoxybenzene	1.98	C
$C_{12}H_9NO_3$	*p*-Nitrophenoxybenzene	4.54	B
$C_{12}H_{10}$	Phenylbenzene (diphenyl)	0	S
$C_{13}H_{11}BrO$	*p*-Bromophenoxy-*p*-toluene	2.45	C
$C_{14}H_{14}O$	Bis(*p*-tolyl) ether	1.54	C
$C_{15}H_{21}AlO_6$	Tris(2,4-pentanedionato) aluminum	0	S
$C_{15}H_{21}CrO_6$	Tris(2,4-pentanedionato) chromium (III)	0	S
$C_{15}H_{21}FeO_6$	Tris(2,4-pentanedionato) iron (III)	0	S
$C_{20}H_{28}O_8Th$	Tetrakis(2,4-pentanedionato) thorium	0	S

DIPOLE MOMENTS

The method of measurement of the dipole moments is indicated in the following **two tables** by the symbols:

B benzene solution
C carbon tetrachloride solution
D 1,4-dioxane solution
H n-heptane solution
St measurement of Stark effect in microwave spectrum of gas

Dipole Moments for Some Inorganic Compounds

Compound	Dipole Moment $\times 10^{-18}$ e. s. u.	Method
$AlBr_3$	5.14	B
AlI_3	2.48	B
CsCl	10.42	St

Dipole Moments for Some Organo-metallic Compounds

Compound	Dipole Moment $\times 10^{-18}$ e. s. u.	Method
Beryllium diethyl	1.0	H
Cadmium diethyl	0.3	H
Mercury diethyl	0.0	H
Magnesium diethyl	4.8	D
Zinc diethyl	0.0	H
Beryllium diphenyl	1.6	B
Cadmium diphenyl	0.6	B
Mercury diphenyl	0.2	B
Magnesium diphenyl	4.9	D
Zinc diphenyl	0.8	B
Chromium (0), diphenyl	0	B
Chromium, ditolyl	0	B
Cobalt, mononitrosyl tricarbonyl	0.72	B
Cyclopentadienyl, chromium dicarbonyl mono nitrosyl	3.23	B
Cyclopentadienyl, manganese tricarbonyl	3.30	B
Cyclopentadienyl, cobalt ducarbonyl	2.87	B
Cyclopentadienyl, vanadium tetracarbonyl	3.17	B
Penta cyclopentadienyl, dicobalt	0	B
Dicyclopentadienyl, iron (II)	0	B
Dicyclopentadienyl, lead (II)	1.63	B
Dicyclopentadienyl, tin (II)	1.02	B
Ethyl lithium	0.87	B
Iron, dinitrosyl dicarbonyl	0.95	B
Iron, tetracarbonyl-diiodide	3.68	B
Iron, tetracarbonyl mono-(methyl isonitrile)	5.07	B
Iron, pentacarbonyl	0.63	B
Iron, bis(p-chlorophenyl cyclopentadienyl	3.12	B
Ruthenium (II), di-indenyl	0	B

Dipole Moments

Dipole Moments of Amino Acid Esters

Substance	$\mu \cdot 10^{18}$ e. s. u.
Glycine ethyl ester	2.11
α-Alanine ethyl ester	2.09
α-Aminobutyric acid ethyl ester	2.13
α-Aminovaleric acid ethyl ester	2.13
Valine ethyl ester	2.11
α-Aminocaproic acid ethyl ester	2.13
β-Alanine ethyl ester	2.14
β-Aminobutyric acid ethyl ester	2.11

Accurate to $\pm 0.01 \cdot 10^{-18}$ e. s. u.
J. Wyman, Chem. Rev., 1936, **19**, 213.

Dipole Moments of Amides

Urea	4.56
Thiourea	4.89
Symm.-dimethylurea	4.8
Tetraethylurea	3.3
Propylurea	4.1
Acetamide	3.6
Sulfamide	3.9
Benzamide	3.6
Valeramide	3.7
Caproamide	3.9

For comprehensive list of dipole moments see Trans. Faraday Soc., 1934, **30**, General Discussion.

Dipole Moments of Somè Hormones and Related Compounds in Dioxan

Cholestane-3(β) : 7(α)-diol	2.31
Cholestane-3(β) : 7(β)-diol	2.55
Cholestane	2.98
Δ^5-Cholestane-3(β)ol-7 one	3.79
Androsterone	3.70
β-Androsterone	2.95
Δ^5-Androstene-3(β) : 17(α)-diol	2.89
Δ^5-Androstene-3(β) : 17(β)-diol	2.69
Δ^5-Androstene-3(β)ol-17 one	2.46
Testosterone	4.32
cis-Testosterone	5.17
Δ^4-Androstene-3 : 17 dione	3.32
Isophorone	3.96

Ethylenic >C=C< in a six membered ring and conjugated with >C=O increases the dipole moment approximately by 1 Debye. Non-conjugated >C=C< in sterols decreases the dipole moment by approximately 0.49. Biological activity is not correlated with dipole moment. W. D. Kumler and G. M. Fohlen, J. Am. Chem. Soc., 1945, **67**, 437.

ELECTRON AFFINITIES

H. O. Pritchard

The tabulated values are given in k cal/gm ion and may be converted into e.v. using the conversion 1 e.v. ≡ 23.06 kcal. All values are experimental determinations, unless marked with a ‡, and refer to the gas phase at 0°K. For more extensive tables see L. M. Branscomb, in "Atomic and Molecular Processes" Ed. D. R. Bates, Academic Press, New York, (1962); H. O. Pritchard, Chemical Reviews, **52,** 529 (1953); F. M. Page, Technical Report DA-91-591-EUC-6-3206 (1965). The compiler is indebted to Drs. L. M. Branscomb and F. M. Page for communicating unpublished data.

NUCLEAR SPINS, MOMENTS, AND MAGNETIC RESONANCE FREQUENCIES

Kenneth Lee and Weston A. Anderson
1967

This table contains the published values for the nuclear spins, magnetic moments, and quadrupole moments, and the calculated values for the nuclear magnetic resonance (NMR) frequency and for the relative sensitivities. Only those isotopes with both published spin and magnetic moment values are tabulated. The magnetic and quadrupole moment values were selected from results published during the period from January, 1955 to June, 1967. Earlier references were obtained from H. E. Walchli, A Table of Nuclear Moment Data, U.S. Atomic Energy Commission Report ORNL—1469, Supplement I (1953) and Supplement II (1955), and D. Streminger, J. M. Hollander, and G. T. Seaborg, Table of Isotopes, Rev. Mod. Phys. **30**, 585 (1958). A table containing the known (1963) spin and electromagnetic moment values of nuclear ground and excited states has been compiled by I. Lindgren, Perturbed Angular Correlations; E. Karlsson, E. Mathias, and K. Siegbahn, editors; North-Holland Publishing Co. (1964). The magnetic moments given in this latter table are corrected for the diamagnetic effect. A more complete list of spin and moment results for nuclei in excited states are included in Lindgren's table.

In general, the results chosen for this table were selected with an inclination to NMR measurements and to the precision of the measurement. Only six significant figures are used in this table. Therefore, the number of figures may be less than those published. The experimental methods employed in determining the moments are indicated by the following symbols:

Ab = atomic beam magnetic resonance (hyperfine structure, double or triple resonance or other method)
E = electron spin resonance or electron-nuclear double resonance
M = microwave absorption in gases
Mb = molecular (or diamagnetic) beam magnetic resonance
Mc = miscellaneous
Mo = Mössbauer effect
N = nuclear magnetic resonance
No = nuclear orientation
O = optical spectroscopy (hyperfine structure, band structure, double resonance, or optical pumping)
Qr = quadrupole resonance

Other symbols used in the table are:

A = atomic weight (mass number)
El = element
I = nuclear spin in units of $h/2\pi$
μ = magnetic moment in units of the nuclear magneton $eh/4\pi Mc$
m = metastable excited state
Q = quadrupole moment in units of barns (10^{-24} cm^2)
Z = atomic number
* = radioactive isotope
• = magnetic moment observed by NMR
( ) = assumed or estimated values

Assuming a nuclear magneton value of 5.0505×10^{-24} erg/gauss, the NMR frequency was calculated for a total field of 10^4 gauss. The sensitivities, relative to the proton, are calculated from the following expressions:

$$\text{Sensitivity at constant field} = 7.652 \times 10^{-3}\mu^3 (I+1)/I^2$$
$$\text{Sensitivity at constant frequency} = 0.2387\ \mu(I+1).$$

These expressions assume an equal number of nuclei, a constant temperature, and $T_1 = T_2$ (the longitudinal relaxation time equals the transverse relaxation time). These sensitivities represent the ideal induced voltage in the receiver coil at saturation and with a constant noise source. The calculated values are therefore determined under complete optimum conditions and should be regarded as such.

ELECTRON WORK FUNCTIONS OF THE ELEMENTS

From data published up to 1954
Compiled by Herbert B. Michaelson

Preferred values for well-outgassed polycrystalline materials are indicated by an asterisk (*). Because of the anisotropy and allotropy of work function, however, the designation "preferred value" has a rather limited meaning.

Values are expressed in electron-volts.

Each value is followed by a reference to the literature.

Superconductivity

Compiled by B. W. Roberts

General Electric Research Laboratory, Schenectady, New York

The sensitivity of superconductive properties to the state of the material is most pronounced. Annealing, cold-working, homogeneity, dislocation densities, and the presence of impurity atoms and other scattering centers are all capable of controlling the critical temperature and magnetic properties of a specific material.

Table I lists the elements and some of their superconductive properties.

Table II contains a collection of some superconductive materials. All compositions are reported on an atomic basis; i.e., AB, AB_2, or AB_3 for compounds, unless noted. Solid solutions or odd compositions may be denoted as A_zB_{1-z} or A_zB. A series of three or more alloys is indicated by A_xB_y or by actual indication of the atomic fraction range such as $A_{0-.6}B_{1-.4}$. The critical temperatures of such a series of alloys is denoted by a range of values or possibly the maximum value.

A more extensive listing of superconductive materials, together with references to the original literature may be found in *Progress in Cryogenics*, Vol. IV.

TABLE II. SUPERCONDUCTIVE MATERIALS

Symbols Used:

*	Eutectic alloy	°	Impure material
Δ	Uncertain composition	C	Calorimetric determination
R	Resistance measurements	VA	Valence electron/atom

M Denotes maximum T_c in specimen series.

∞ All cell edges are intended to be quoted in angstrom units.

$T_c'(—)$ Denotes incremental changes in T_c from pure metal.

KEY TO CRYSTAL STRUCTURE TYPES FOUND IN TABLE II

"Strukturbericht" Type	Example	Class
A1	Cu	Cubic, FC
A2	W	Cubic, BC
A3	Mg	Hexagonal, close packed
A4	Diamond	Cubic, FC
A5	White Sn	Tetragonal, BC
A6	In	Tetragonal, BC (FC cell usually used)
A7	As	Rhombohedral
A8	Se	Trigonal
A10	Hg	Rhombohedral
A12	α-Mn	Cubic, BC
A13	β-Mn	Cubic
A15	β-W	Cubic
B1	NaCl	Cubic, FC
B2	CsCl	Cubic
$B8_1$	NiAs	Hexagonal
B10	PbO	Tetragonal
B11	γ-CuTi	Tetragonal
B18	CuS	Hexagonal
B20	FeSi	Cubic
B31	MnP	Orthorhombic
B32	NaTl	Cubic, FC
B_f	ζ-CrB	Orthorhombic
B_g	MoB	Tetragonal, BC
B_h	WC	Hexagonal
B_i	γ′-MoC	Hexagonal
Cl	CaF_2	Cubic, FC
Cl_b	MgAgAs	Cubic, FC
C2	FeS_2	Cubic
C6	CdI_2	Trigonal

"Strukturbericht" Type	Example	Class
$C11_b$	$MoSi_2$	Tetragonal, BC
C14	$MgZn_2$	Hexagonal
C15	Cu_2Mg	Cubic, FC
$C15_b$	$AuBe_5$	Cubic
C16	$CuAl_2$	Tetragonal, BC
C18	FeS_2	Orthorhombic
C32	AlB_2	Hexagonal
C36	$MgNi_2$	Hexagonal
C49	$ZrSi_2$	Orthorhombic
C54	$TiSi_2$	Orthorhombic
C_c	Si_2Th	Tetragonal, BC
DO_3	BiF_3	Cubic, FC

TABLES OF PROPERTIES OF SEMICONDUCTORS

Compiled by Dr. Brian Randall Pamplin,
School of Physics,
Bath University of Technology,
Ashley Down,
Bristol, 7, England.

The term "semiconductor" is applied to a material in which electric current is carried by electrons or holes and whose electrical conductivity when extremely pure rises exponentially with temperature and may be increased from this low "intrinsic" value by many orders of magnitude by "doping" with electrically active impurities.

Semiconductors are characterised by an energy gap in the allowed energies of electrons in the material which separates the normally filled energy levels of the *valence band* (where "missing" electrons behave like positively charged current carriers "holes") and the *conduction band* (where electrons behave rather like a gas of free negatively charged carriers with an effective mass dependent on the material and the direction of the electrons' motion). This energy gap depends on the nature of the material and varies with direction in anisotropic crystals. It is slightly dependent on temperature and pressure, and this dependence is usually almost linear at normal temperatures and pressures.

The data is presented in three tables. Table I "General Properties of Semiconductors" lists the main crystallographic and semiconducting properties of a large number of semiconducting materials in three main categories; "Tetrahedral Semiconductors" in which every atom is tetrahedrally co-ordinated to four nearest neighbour atoms (or atomic sites) as for example in the diamond structure; "Octahedral Semiconductors" in which every atom is octahedrally co-ordinated to six nearest neighbour atoms—as for example in the halite structure; and "Other Semiconductors".

Table II gives more detailed information about some better known semiconductors, while Table III gives some information about the electronic energy band structure parameters of the best known materials.

TABLE I

GENERAL PROPERTIES OF SEMICONDUCTORS

(listed by Crystal Structure)

Substance	Lattice Parameters (A° Room temperature)	Density (gm/cc)	Melting Point (°K)	Minimum Room Temperature Energy Gap (eV)	Thermal Conductivity	Heat of Formation k cal/mole	Mobility (Room Temperature) Electrons	Holes (cm²/V.s)	Remarks

PbTe	0.25	4 in [111] at "L"	0.21	0.029	5.5	
Bi_2Te_3	0.13	6			~0.05	

STANDARD CALIBRATION TABLES FOR THERMOCOUPLES

The following tables which represent the Temperature-E. M. F. functions of various thermocouples should be used with appropriate correction curves if precise results are desired. These curves must be determined for each individual couple by plotting ΔE, the difference between the observed and the standard E. M. F., against the standard E. M. F. at three or more fixed temperature points. The value ΔE as shown by such a correction curve is then subtracted algebraically from the observed E. M. F. to give the true E. M. F. reading.

In the following tables the fixed or "cold junction" is at 0° C.; when the cold junction is not maintained at 0° C. the readings of the E. M. F. must be corrected as follows: $Et = E(t_{-tc}) + Etc$ where $E(t_{-tc})$ is the observed reading, Etc is the E. M. F. for the temperature corresponding to the cold junction temperature as read from the standard table and Et is the E. M. F. produced by the hot junction corrected to the value which would be obtained with the cold junction at 0° C. The temperature corresponding to Et is then obtained by reference to the standard table.

Since the E. M. F.-temperature function is not linear the cold junction should be maintained at a temperature very close to that at which the thermocouple was calibrated. Otherwise considerable error will result despite the above correction.

VALUES FOR THE LANGEVIN FUNCTION $\mathcal{L}(u)$

Compiled by Allen L. King

Because of random thermal rotations a dipole or dipole-like element ordinarily has an average dipole moment of zero. If it is placed in an orienting field F however it tends to align itself with the field so that the average component of the dipole moment parallel to the field equals $\bar{p}$. Classically, if the system is in thermal equilibrium,

$$\bar{p} = p_0(\coth u - 1/u) = p_0\mathcal{L}(u)$$

Here p_0 is the moment of the dipole itself and $\mathcal{L}(u)$ is the Langevin function of the argument u which equals Fp_0/kT.

$$\text{For } u \ll 1 \quad \mathcal{L}(u) = \frac{u}{3}$$

The Langevin function applies to permanent electric and magnetic dipoles.

V_2O_3		170			

1. θ_N = Néel temperature, determined from susceptibility maxima or from the disappearance of magnetic scattering.
2. θ_P = a constant in the Curie-Weiss law written in the form $\chi_A = C_A/(T + \theta_P)$, which is valid for antiferromagnetic material for $T > \theta_N$.
3. $(P_A)_{eff}$ = effective moment per atom, derived from the atomic Curie constant $C_A = (P_A)^2_{eff}(N^2/3R)$ and expressed in units of the Bohr magneton, $\mu_B = 0.9273 \times 10^{-20}$ erg gauss^{-1}.
4. P_A = magnetic moment per atom, obtained from neutron diffraction measurements in the ordered state.

SATURATION CONSTANTS AND CURIE POINTS OF FERROMAGNETIC ELEMENTS

Element	σ_s (20°C)	M_s (20°C)	σ_s (0°K)	n_B	Curie Point (°C)
Fe	218.0	1,714	221.9	2.219	770
Co	161	1,422	162.5	1.715	1,131
Ni	54.39	484.1	57.50	0.604	358
Gd	0	0	253.5	7.12	16

σ_s = saturation magnetic moment/gram; M_s = saturation magnetic moment/cm^3, in cgs units. n_B = magnetic moment per atom in Bohr magnetons.

MAGNETIC SUSCEPTIBILITY OF THE ELEMENTS AND INORGANIC COMPOUNDS

The following table lists the magnetic susceptibilities of one gram formula weight of a number of paramagnetic and diamagnetic inorganic compounds as well as the magnetic susceptibilities of the elements.

In each instance the magnetic moment is expressed in cgs units.

A more extensive listing of the magnetic susceptibilities of inorganic compounds as well as those for organic compounds may be found in Constantes Selectionnees Diamagnetisme et Paramagnetisme Relaxation Paramagnetique, Volume 7. This table is abridged from the above publication by permission of the publishers.

DIAMAGNETIC SUSCEPTIBILITIES OF ORGANIC COMPOUNDS

Compiled by George W. Smith

This table and its supplement contain values for the molar susceptibility of χ_M, specific susceptibility χ, and volumetric susceptibility K. The cgs Gaussian system of units is employed. In the Gaussian units the relation between magnetic induction B and magnetic field strength H is

$$B = H + 4\pi I \qquad (1)$$

where I is the magnetization or magnetic moment per unit volume. Actually, the quantities involved in equation (1) are all vectors, but one may assume that all three are collinear, a reasonable assumption for organic diamagnetic substances in the liquid state. For crystals I may vary with crystal orientation. Equation (1) may be written

$$B = H + 4\pi KH = (I + 4\pi K)H \qquad (2)$$

Here, K is the magnetic susceptibility, often called the volumetric susceptibility and is a unitless quantity.

Other susceptibilities of use to chemists and physicists are the specific or mass susceptibility which is defined

$$\chi = K/\rho \qquad (3)$$

where ρ is the density of the sample in grams per cc., and the molar susceptibility which is defined as

$$\chi_M = M\chi = MK/\rho \qquad (4)$$

where M is the molecular weight of the substance in grams.

Temperatures, when listed, are enclosed in parentheses and are listed in degrees C.

Literature references for values contained in this table may be found in General Motors Research Laboratories Bulletins GMR-317 and GMR-396.

MASS ABSORPTION COEFFICIENTS FOR X AND γ RAYS

Radiation traversing a layer of substance is reduced in intensity by a constant fraction μ per centimeter. After penetrating to a depth x the intensity is $I = I_0 e^{-\mu x}$ where I_0 is the intensity at the surface. μ/ρ is the mass absorption coefficient where ρ is the density of the material.

Values of μ/ρ for $\lambda = .005$ Å to $\lambda = 44.6$ Å. Where two values of μ/ρ for one value of λ occur they represent the maximum and minimum values at an absorption discontinuity.

Compiled by S. J. M. Allen

$\lambda = 44.6 - 2.74$ Å

MASS ABSORPTION COEFFICIENTS FOR X AND γ RAYS (Continued)

Values of μ/ρ for E = 2.00 Mev to E = 20.0 Mev.

Computed by G. Allen. Reproduced by permission of the National Aeronautics and Space Administration

$\mu = \gamma + \sigma + \chi$

where γ is the photoelectric absorption coefficient; σ is the Compton scattering coefficient calculated; and χ is the pair-formation coefficient.

X-RAY WAVELENGTHS

J. A. Bearden

These tables were originally published as the final report to the U.S. Atomic Energy Commission as Report NYO-10586 in partial fulfillment of Contract AT(30-1)-2543. The tables were later reproduced in *Review of Modern Physics*. The data may also be obtained from the Superintendent of Documents, U.S. Government Printing Office, Washington, D. C. 20402 in the publication NSRDS-NBS 14. Persons seeking discussion of the experimental work, conventions, secondary standards, etc. will find these in *Review of Modern Physics*, Vol. 39, No. 1, 78-124, January 1967.

THE W $K\alpha_1$ WAVELENGTH STANDARD

A wavelength standard should possess characteristics which permit its ready redetermination in other laboratories by different techniques. Considering all of the factors involved in the selection of a wavelength standard, the W $K\alpha_1$ line is superior to any other x-ray or γ-ray wavelength. Its advantages as the x-ray wavelength standard are discussed in *Review of Modern Physics* Vol. 39, page 82 (1967).

$$\lambda \text{W } K\alpha_1 = 0.2090100 \text{ Å} \pm 5 \text{ ppm}.$$

This numerical value of the wavelength of the W $K\alpha_1$ line is used to define the *x-ray wavelength standard* by the relation

$$\lambda(\text{W } K\alpha_1) = 0.2090100 \text{ Å}^*.$$

This is a new unit of length which may differ from the angstrom by ± 5 ppm (probable error), *but as a wavelength standard it has no error*. In order to clearly indicate that this unit is not exactly an angstrom, it has been designated Å*.

Wavelengths tabulated normally refer to the pure element in its solid form. However, there are many instances in which such data are not available. For example, rare gases are of necessity almost always used in the gaseous form, while the rare-earth elements were customarily used in the form of salts.

In high precision work there is some ambiguity as to exactly what feature of a line profile should be taken to be the "true wavelength." In double-crystal work the line peak is usually employed. In crystallography the centroid is widely used; in photographic work with visual observation of the plates, there is involved some subjective criterion of the observer which it is difficult to define precisely. In this survey the peak of the line profile has been adopted as the standard criterion.

X-RAY WAVELENGTHS

X-ray wavelengths in Å* units and in keV. The probable error (p.e.) is the error in the last digit of wavelength. Designation indicates both conventional Siegbahn notation (if applicable) and transition, e.g., β_1 $L_{II}M_{IV}$ denotes a transition between the L_{II} and M_{IV} levels, which is the $L\beta_1$ line in Siegbahn notation.

X-RAY ATOMIC ENERGY LEVELS

J. A. Bearden and A. F. Burr

These tables were originally published as the final report to the U.S. Atomic Energy Commission as Report NYO-2543-1 in partial fulfillment of Contract AT(30-1)-2543. The tables were later reproduced in *Review of Modern Physics.* The data may also be obtained from the Superintendent of Documents, U.S. Government Printing Office, Washington, D. C. 20402 in the publication NSRDS-NBS 14. Persons seeking discussion of the details of calculations, sources of energy level information and the problem of properly interpreting the experimental measurements should refer to the original publication or to *Review of Modern Physics,* Vol. 39, 125–142, January 1967.

All of the x-ray emission wavelengths have recently been reevaluated and placed on a consistent Å* scale. For most elements these data give a highly overdetermined set of equations for energy level differences, which have been solved by least-squares adjustment for each case. This procedure makes "best" use of all x-ray wavelength data, and also permits calculation of the probable error for each energy difference. Photoelectron measurements of absolute energy levels are more precise than x-ray absorption edge data. These have been used to establish the absolute scale for eighty-one elements and, in many cases, to provide additional energy level difference data. The x-ray absorption wavelengths were used for eight elements and ionization measurements for two; the remaining five were interpolated by a Moseley diagram involving the output values of energy levels from adjacent elements. Probable errors are listed on an absolute energy basis. In the original source of the present data, a table of energy levels in Rydberg units is given. Difference tables in volts, Rydbergs, and milli-Å* wavelength units, with the respective probable errors, are also included there.

X-RAY ATOMIC ENERGY LEVELS

Recommended values of the atomic energy levels, and probable errors in eV. Where available, photoelectron direct measurements are listed in brackets [ ] immediately under the recommended values. The measured values of the x-ray absorption energies are shown in parentheses ( ). Interpolated values are enclosed in angle brackets ⟨ ⟩.

The wavelengths in Angstroms for the K absorption edge of elements having atomic numbers 3 to 11 and 83 to 100 were calculated from critical X-ray absorption energies listed in the Review of Scientific Instruments, **23,** 523–528. (1952.)

All wavelengths for the L absorption edges were calculated from absorption energies given in the above reference.

Values for the M, N, and O absorption edges are also listed in the above reference. The wavelengths in Angstroms for the K absorption edge of the elements having atomic numbers 12 to 82 are reproduced by permission from Structure of Metals, Barrett, 2nd edition, McGraw-Hill Book Company, Inc. (1952.)

PHOTOMETRIC QUANTITIES, UNITS AND STANDARDS

Photometric quantities and units are also given in the section Quantities and Units under the sub-division Light.

Candle (or International Candle). The candle is the unit of luminous intensity. It is a specified fraction of the average horizontal candlepower of a group of 45 carbon-filament lamps preserved at the Bureau of Standards.

Candle (new unit). $\frac{1}{60}$ of the intensity of one square centimeter of a blackbody radiator at the temperature of solidification of platinum (2,046°K).

Foot-candle. Foot-candle = 1 lumen incident per ft^2 = 1.076 millilphots = 10.76 lux.

Lumen. The lumen is the unit of luminous flux. It is equal to the flux through a unit solid angle (steradian) from a uniform point source of one candle, or to the flux on a unit surface all points of which are at unit distance from a uniform point source of one candle.

Illumination. Illumination is the density of the luminous flux on a surface. It is the quotient of the flux by the area of the surface when the latter is uniformly illuminated.

Least Mechanical Equivalent of Light. One lumen at the wavelength of maximum visibility (0.556μ) equals 0.00161 watts (= 0.000385 gram calories per sec.); one watt at the same wavelength equals 621 lumens.

Relative Visibility. The relative visibility factor for a particular wavelength is the ratio of the visibility factor for that wavelength to the maximum visibility factor.

Values of the relative visibility are given as a part of the specification of the standard observer under Colorimetry.

Efficiency of a Source of Light. The efficiency of a source is the ratio of the total luminous flux to the total power consumed. In the case of an electric lamp it is expressed in lumens per watt.

Spherical Candlepower. The spherical candlepower of a lamp is the average candlepower of the lamp in all directions in space. It is equal to the total luminous flux of the lamp in lumens divided by 4π

Lambert is the unit of brightness equal to $1/\pi$ candle per square centimeter.

Foot-lambert is the unit of photometric brightness (luminance) equal to $1/\pi$ candle per square foot.

FLAME STANDARDS

VALUE OF VARIOUS FORMER STANDARDS IN INTERNATIONAL CANDLES

Standard Pentane Lamp, burning pentane	10.0 candles
Standard Hefner Lamp, burning amyl acetate	0.9 "
Standard Carcel Lamp, burning colza oil	9.6 "

The *Carcel unit* is the horizontal intensity of the carcel lamp, burning 42 grams of colza oil per hour. For a consumption between 38 and 46 grams per hour the intensity may be considered proportional to the consumption.

The *Hefner unit* is the horizontal intensity of the Hefner lamp burning amyl acetate, with a flame 4 cm. high. If the flame is l mm. high, the intensity $I = 1 + 0.027(l - 40)$.

EFFICIENCIES OF ILLUMINANTS

Compiled by J. M. Smith and C. E. Weitz

The rating listed is the commercial rating of the lamp. The absolute efficiency is the equivalent power in light flux (0.556μ) per watt input. Efficiency is given in lumens per watt input.

Lamp	Rating, or Specification	Eff.	Ab. Eff.
Acetylene	1.0 liters per hour	0.67	0.0010
Arc, Electric			
Carbon, Enclosed d.c.	6.6 amps. opal globe & reflector	5.9	0.0087

FLAME SPECTRA OF THE ELEMENTS

By Paul T. Gilbert, Jr., Beckman Instruments, Inc.

Reproduced by permission from Handbook of Analytical Chemistry, edited by Louis Meites. Copyright 1962, McGraw-Hill Book Company.

The following table lists the principal lines and bands emitted by the elements in various flames used in analytical flame spectrophotometry. This table is followed by an index of these emissions according to wavelength, as an aid to identifying an unknown flame spectrum. Since some elements have much stronger or richer spectra than others, it must be kept in mind that of the hundreds of known flame emissions omitted from these tables, many are stronger than certain relatively weak emissions that are included. Among the elements for which no quantitative data are available, osmium, iridium, and thorium are said to emit only continua, while hafnium, tantalum, and tungsten probably do likewise; selenium may emit a useful band spectrum under the proper conditions.

The tabulated intensity is given by $J = 100(R - B)/B$, where B is the blank reading (pure solvent) and R is the reading for a solution containing 10 mg of the element per liter, for the slit width at which, for the blank, shot-effect noise equals flame flicker; the instrument is a Beckman DU spectrophotometer with photomultiplier and flame attachments, optimally adjusted for each element and flame. Intensities are given for air-hydrogen (*AH*), oxyhydrogen (*OH*), and oxyacetylene (*OA*) flames. (In Table II the intensity is for *OH* unless otherwise indicated.) Under *AH*, *OH*, and *OA* are data for aqueous solutions. Under *AHn*, *OHn*, and *OAn* are data for the most favorable known nonaqueous solvent. The solvent is indicated by the symbol following the first of the set of data to which it applies. The symbol in the Character column applies to all data in that line except as indicated ahead of any given intensity value. The slit widths implied above, for aqueous solutions, are about .5 mm for *AH*, .10–.15 mm for *OH*, and .02–.05 mm for *OA*, in the range 330–550 mμ; they are smaller at 280–330 mμ, and wider below 280 and above 550 mμ, being about twice as wide at 620 as at 550 mμ. Nonaqueous solutions permit narrower slits. In working with lines, narrower slits than those implied by the definition of J—usually not over .05 mm—can be used without loss of sensitivity.

Detection limits for various flame spectrophotometers can be estimated from these intensity data. Detection limit D is here defined as the minimal concentration of element in mg/liter (in a solution containing no interfering materials) yielding a net signal equal to total peak-to-peak noise for a time constant of 1 second. For the DU with photomultiplier up to about 700 mμ, $D = 10/J$; for the red-sensitive phototube of the DU, $D = 300/J$ for lines and $10/J$ to $100/J$ for bands (depending on wavelength, flame, and width of the band). For the DU with blue-sensitive phototube, $D = 100/J$ to $200/J$ for lines and $10/J$ to $20/J$ for most bands, up to about 630 mμ, beyond which the red-sensitive tube is used. Intensities marked with *k* apply to a red-sensitive photomultiplier and must be divided by 30 (for lines) before these formulas for D are applied for the red-sensitive phototube. For the Beckman Model B, with either photomultiplier or phototubes, multiply D as found for the DU (with photomultiplier or phototubes, respectively) by 5, down to 350 mμ; at 330 mμ the factor is 10, and at 320 mμ it is 15. For the Beckman DK-2 spectrophotometer, $D = 20/J$ for lines and $10/J$ for bands. For the Beckman DB spectrophotometer, $D = 40/J$ for lines and $20/J$ for bands. The DK-2 and DB are not recommended for flame photometry beyond 700 mμ. The Zeiss PMQ II flame spectrophotometer and the Hitachi EPU-2A spectrophotometer with H-2 flame attachment should yield J and D values similar to those for the DU. The Unicam SP.900 Mark II flame spectrophotometer, the Optica CF-H spectrometer with flame attachment and possibly the Jobin-Yvon research model also give similar values, but they do not resemble the DU as closely as the Zeiss and Hitachi instruments. The Waters Associates flame photometer probably gives somewhat higher values of J, but data are not available. The data below are not applicable to flame photometers with filters or to flame spectrophotometers utilizing other flames or lacking atomizer-burners.

To supplement these tables, the reader is referred to the collections of recorded flame spectrograms in the following publications:

Herrmann and Alkemade, "Flammenphotometrie," 2nd edition, Springer, Berlin, 1960.
Dean, "Flame Photometry," McGraw-Hill, New York, 1960.
Gilbert, "Symposium on Spectroscopy," ASTM STP 269, p. 73 (1960).
Watanabe and Kendall, *Appl. Spectroscopy 9*, 132 (1955).
Rains, House and Menis, *Anal. Chim. Acta 22*, 315 (1960) (rare earths).

Many of the data in these tables are calculated from unpublished results supplied by V. A. Fassel and R. N. Curry (Iowa State University), J. A. Dean (University of Tennessee), B. E. Buell (Union Oil Co. of California), W. Schmidt (Forschungsinstitut der Feuerfest-Industrie, Bonn), and H. Watanabe and Miss Jean E. Kinnear (Beckman Instruments, Inc., Fullerton, California). Many of the data on rare earths were supplied in advance of publication by O. Menis (Oak Ridge National Laboratory). The kindness of these colleagues in providing this information is gratefully acknowledged.

Abbreviations

a = arc line
AA = acetylacetone
Ac = acetone
b = peak of a band without conspicuous head
Bu = butanol
Bz = benzene
c = continuum or very wide, featureless band; wavelength indicates general region of greatest intensity. If c follows a, b, r, etc., the latter emission is superposed upon an at least equally strong continuum.
C = chloroform
d = double
EA = 1:2:1 ether-alcohol-water
f = intercombination line
G = gasoline
H = hexone (methyl isobutyl ketone)
HAP = 50% hexone, 20% acetone, 20% isopropanol, 10% water
i = line occurring in inner cone of flame
k = intensity for Farnsworth 16PMI photomultiplier
K = kerosene
m = multiple band, resolved with narrow slits
M = methanol
n = flame background band occurring with organic solvents (in the index table).
N = naphtha
Oc = 2-octanone
p = resonance line
P = isopropanol
r = head of band degraded to red
s = spark line
t = triple
u = unclassified line
v = head of band degraded to violet
w = wide or diffuse band
x = with uncoated mirror in burner housing (mirror normally has a silicone coating).
( ) denote doubtful or roughly estimated data
Subscript numerals indicate volume percentage: Ac_{60} = 60% acetone (and 40% water).

* Numbers with asterisks refer to footnotes.

*[1] Seen in absorption against an effectively hotter band head of OH. [2] Obscured by C_2 bands. [3] Data to be supplied by Kniseley, Fassel and Curry, *Spectrochimica Acta*. [4] Obscured by CH bands. [5] Bands observed only with iodate ion. [6] With red filter to reduce stray light. [7] The arc lines 382.94, 383.23, 383.83 may appear within this band, especially in hotter flames. [8] The stronger CN bands 386.2, 387.1, 388.3 are interfered with by the CH bands 387.1, 388.9. [9] Emitted by ethyl silicate.

STANDARD WAVE LENGTHS

Primary Standard

Wave length of the red cadmium line in air, 760 mm. pressure 15°C. measures of Benoit, Fabry and Perot 1907.

6438.4696 Ångström units

Secondary Standards

Lines of the Iron Arc

Selected lines from list by Ch. Fabry: *International Critical Tables*, 1929
Wave lengths in international Ångströms, atmospheric pressure, 15°C

Iron, Wave Lengths in the Ultraviolet Spectrum

The following table presents the results of interferometer measurements made by Meggers and Humphreys and reported in the Jour. Research of B of S. **18**, 543, 1937. The standard iron arc was used as a source and the wave lengths in air at 15°C. and 76 mm are given in international Ångströms.

Iron, Wave Lengths in the Infrared

From interferometer measurements by Meggers, Jour. Research of B. of S. **14**, 33, 1935. The integrated light from the iron arc was used as a source. Wave lengths in air at 15°C and 760 mm are given as well as the intensity.

Neon

From Meggers and Humphreys, Jour Research of B. of S **13**, 293, 1934. The source was an "end on" Geissler tube Values are given for the wave length in air at 15°C and 760 mm pressure, and referred to the primary standard (Cd 6438.4696 A) and also to the red lines of neon. For complex lines the value for the principal component is given.

PERSISTENT LINES OF THE ELEMENTS

Spectra of the neutral atom, the singly ionized atom, and the doubly ionized atom are indicated by I, II, and III, respectively. The most sensitive lines are indicated by an asterisk (*). The symbol "D" preceding the intensity indicates the discharge-tube spectrum. Wave lengths are given in International Ångstrom units.

Wave lengths and intensities of lines between 2000 and 9999 ångstroms have been given according to the M.I.T. Wavelength Tables.

The secondary emission yield, or secondary emission ratio, δ, is the average number of secondary electrons emitted from a bombarded material for every incident primary electron. The secondary emission yield is a function of the primary electron energy. δ_{max} is the maximum yield corresponding to a primary electron energy $E_{p\,max}$ (see figure). The two primary electron energies corresponding to a yield of unity are denoted the first and second crossovers (E_I and E_{II}). An insulating target, or a

conducting target that is electrically floating, will charge positively or negatively depending on the primary electron energy. For $E_I < E_p < E_{II}$, $\delta > 1$ and the surface charges positively provided there is a collector present that is positive with respect to the target. For $E_p < E_I$, $\delta < 1$, and the surface charges negatively towards the potential of the source of primary electrons. For $E_p > E_{II}$, $\delta < 1$, and the surface charges negatively to the second crossover.

The secondary emission yield is very sensitive to surface contamination, such as oxide films and carbon deposits. Whenever possible, yields believed to be most typical of clean surfaces have been selected. The yields are for measurements at room temperature and normal incidence of the primary electrons.

Table I

Secondary Electron Emission Properties of Elements and Compounds. δ_{max} is the maximum secondary emission yield, $E_{p\,max}$ the primary electron energy for maximum yield, and E_I and E_{II} are the first and second crossovers.

EMISSIVITY OF TUNGSTEN

LIQUIDS FOR INDEX BY IMMERSION METHOD

Liquid	N_D 24° C
Trimethylene chloride	1.446
Cineole	1.456
Hexahydrophenol	1.466
Decahydronaphthalene	1.477
Isoamylphthalate	1.486
Tetrachloroethane	1.492
Pentachloroethane	1.501
Trimethylene bromide	1.513
Chlorobenzene	1.523
Ethylene bromide + Chlorobenzene	1.533
o-Nitrotoluene	1.544
Xylidine	1.557
o-Toluidine	1.570
Aniline	1.584
Bromoform	1.595
Iodobenzene + Bromobenzene	1.603
Iodobenzene + Bromobenzene	1.613
Quinoline	1.622
α-Chloronaphthalene	1.633
α-Bromonaphthalene + α-Chloronaphthalene	1.640–1.650
α-Bromonaphthalene + α-Iodonaphthalene	1.660–1.690
Methylene iodide + Iodobenzene	1.700–1.730
Methylene iodide	1.738
Methylene iodide saturated with sulfur	1.78
Yellow phosphorus, sulfur and methylene iodide (8:1:1 by weight)	2.06
Can be diluted with methylene iodide to cover range 1.74–2.06. For precautions in use, cf. West, Am. Mineral, **21,** p. 245–9 (1936).	

HEAVY LIQUIDS FOR MINERAL SEPARATION

Liquid	Density
Tetrabromoethane (sym.)	2.964, 20°/4°
Can be diluted with carbon tetrachloride (1.595) or benzene (0.894).	
Methylene iodide	3.325, 20°/4°
Can be diluted with carbon tetrachloride or benzene.	
Thallium formate, aq	ca. 5
Can be diluted with water.	
Thallium malonate-thallium formate, aq	4.9
Can be diluted with water.	

For preparation and recovery of these liquids, cf. U. S. Bureau Mines, Rept. Inv. #2897 (1928).

INDEX OF REFRACTION

Indices of refraction for elements, inorganic, metal-organic and organic compounds and minerals will be found in the tables of physical constants for the various classes of substances in the section Properties and Physical Constants.

Values for compounds not there listed and data subsequently collected are given below.

Indices not otherwise indicated are for sodium light, $\lambda = 589.3$ mμ. Other wave lengths are indicated by the value in millimicrons or symbol in parentheses which follows the index. Wave lengths are indicated as follows: He, $\lambda = 587.6$ mμ; Li, $\lambda = 670.8$ mμ; Hg, $\lambda = 579.1$ mμ; A, $\lambda = 759.4$ mμ; C, $\lambda = 656.3$ mμ; D, $\lambda = 589.3$ mμ; F, $\lambda = 486.1$ mμ.

Temperatures are understood to be 20°C for liquids, or ordinary room temperatures in the case of solids. Other temperatures appear as superior figures with the index.

Indices for the elements and inorganic compounds will be understood to be for the solid form except as indicated by the abbreviation liq.

See also under Physical Constants of Inorganic Compounds and index of Refraction of Gases.

Elements

Name	Formula	Index
Bromine (liq.)	Br_2	1.661^{15}
Cadmium (liq.)	Cd	0.82 (579 mμ)
(sol.)		1.13
Chlorine (liq.)	Cl_2	1.385
" (gas)		1.000768
Hydrogen (liq.)	H_2	$1.10974^{-252.83}$(579 mμ)
Iodine (sol.)	I_2	3.34
(gas)		1.001920
Lead	Pb	2.6 (579 mμ)
Mercury (liq.)	Hg	1.6–1.9
Nitrogen (liq.)	N_2	1.2053^{-190}

Aluminum carbide	Al_4C_3	2.7, 2.75 (700 mμ)
chloride	$AlCl_3.6H_2O$	1.560, 1.507
oxide	Al_2O_3	1.665–1.680, 1.63–1.65
Alums. See under appropriate element.		
Ammonium antimonyl tartrate	$2(NH_4.SbO.C_4H_4O_6).H_2O$	β1.6229 (C)
*ortho*arsenate, di-H	$NH_4H_2AsO_4$	1.5766, 1.5217
bromide	NH_4Br	1.7108
*per*chlorate	NH_4ClO_4	1.4818, 1.4833, 1.4881
chloroplatinate	$(NH_4)_2PtCl_6$	1.8
fluoride	NH_4F	ω<1.328
" acid	NH_4HF_2	1.385, 1.390, 1.394
hydrogen malate.(*d*)	$NH_4C_4H_5O_5$	β1.503
nitrate	NH_4NO_3	1.413, 1.611(He), 1.63
Ammonium sulfate, acid	NH_4HSO_4	1.463, 1.473, 1.510
tartrate (*dl*)	$(NH_4)_2C_4H_4O_6.2H_2O$	β1.564
thiocyanate	NH_4CNS	1.546, 1.685, 1.692
uranyl acetate	$NH_4C_2H_3O_2.UO_2(C_2H_3O_2)_2$	1.4808, 1.4933
Antimony bromide	$SbBr_3$	>1.74+
iodide, tri-	SbI_3	2.78 (Li), 2.36
Barium cadmium bromide	$BaCdBr_4.4H_2O$	β1.702
cadmium chloride	$BaCdCl_4.4H_2O$	β1.651
calcium propionate	$BaCa_2(C_3H_5O_2)_6$	1.4442
fluochloride	$BaCl_2.BaF_2$	1.640, 1.633
fluoride	BaF_2	1.475 also 1.4741
Barium oxide	BaO	1.980
*ortho*phosphate, di-	$BaHPO_4$	1.617, 1.63±, 1.635
propionate	$Ba(C_2H_5CO_2)_2.H_2O$	β1.5175
sulfide, mono-	BaS	2.155
Cadmium ammonium chloride	$CdCl_2.4NH_4Cl$	1.6038, 1.6042
cesium sulfate	$CdSO_4.Cs_2SO_4.6H_2O$	1.498, 1.500, 1.506
fluoride	CdF_2	1.56
magnesium chloride	$(CdCl_2)_2.MgCl_2.12H_2O$	1.49, 1.5331, 1.5769
oxide	CdO	2.49 (Li)
potassium chloride	$CdCl_2.4KCl$	1.5906, 1.5907
" cyanide	$Cd(CN)_2.2KCN$	1.4213
rubidium sulfate	$CdSO_4.Rb_2SO_4.6H_2O$	1.4798, 1.4848, 1.4948
Calcium aluminate	$Ca_3Al_2O_6$	1.710
borate	$CaO.B_2O_3$	1.540, 1.656, 1.682
carbide	CaC_2	>1.75
copper acetate	$CaCu(C_2H_3O_2)_4.6H_2O$	1.436, 1.478
cyanamide	$CaCN_2$	1.60, >1.95
dithionate	$CaS_2O_6.4H_2O$	1.[illegible]
*pyro*phosphate	$Ca_2P_2O_7$	[illegible]
platinocyanide	$CaPt(CN)_4.5H_2O$	[illegible]
strontium propionate	$Ca_2Sr(C_2H_5O_2)_6$	[illegible]
sulfide (oldhamite)	CaS	2.137
sulfite	$CaSO_3.2H_2O$	1.590, 1.595, 1.628
thiosulfate	$CaS_2O_3.6H_2O$	1.545, 1.560, 1.605
Carbon dioxide (liq.)	CO_2	1.195^{15}
Cerium dithionate	$Ce_2(S_2O_6)_3.15H_2O$	β1.507
Cesium *per*chlorate	$CsClO_4$	1.4752, 1.4788, 1.4804
nitrate	$CsNO_3$	1.55, 1.56
selenate	Cs_2SeO_4	1.5989, 1.5999, 1.6003
thallium chloride	$Cs_3Tl_2Cl_9$	1.784, 1.774
Chromium cesium sulfate	$CrCs(SO_4)_2.12H_2O$	1.4810
oxide (ic)	Cr_2O_3	2.5
potassium cyanide (ic)	$CrK_3(CN)_6$	1.5221, 1.5244, 1.5373
sulfate (ic)	$Cr_2(SO_4)_3.18H_2O$	1.564
thallium sulfate	$CrTl(SO_4)_2.12H_2O$	1.5228
Cobalt acetate	$Co(C_2H_3O_2)_2.4H_2O$	β1.542
aluminate (Thenard's Blue)	$Co(AlO_2)_2$	>1.78 (red), 1.74 (blue)
ammonium selenate	$CoSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5246, 1.5311, 1.5396
cesium sulfate	$CoCs_2(SO_4)_2.6H_2O$	1.5057, 1.5085, 1.5132
chloride (ous)	$CoCl_2.2H_2O$	<1.625, <1.671, >1.67
potassium selenate	$CoSeO_4.K_2SeO_4.6H_2O$	1.5135, 1.5195, 1.5358
rubidium sulfate	$CoSO_4.Rb_2SO_4.6H_2O$	1.4859, 1.4916, 1.5014
selenate	$CoSeO_4.6H_2O$	β1.5225, γ1.5227
Copper ammonium selenate	$CuSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5213, 1.5355, 1.5395
ammonium sulfate	$CuSO_4.(NH_4)_2SO_4.6H_2O$	1.4910, 1.5007, 1.5054
cesium sulfate	$CuSO_4.Cs_2SO_4.6H_2O$	1.5048, 1.5061, 1.5153
chloride (ic)	$CuCl_2.2H_2O$	1.644, 1.684, 1.742
formate	$Cu(CHO_2)_2.4H_2O$	1.4133, 1.5423, 1.5571

Name	Index
Allontoin, solid	α1.579, γ1.660
Dimethyl thiophene (α, α'), liq	1.5169[13.4] (He)
" " (β, β'), liq	1.5221[7.6] (He)
Ethyl carbylamine, liq	1.3659[24]
Ethylidene cyanhydrin, liq	1.4058[18.6]
Hexyl acetylene (n), liq	1.4208[12.5]

Miscellaneous

Albite glass	1.4890	Magdala red	1.90
Amber	1.546	Obsidian	1.482–1.496
Anorthite glass	1.5755	Paraffin	1.43295[38.3] (C)
Asphalt	1.635	Quartz, fused	1.45640 (656 mμ)
Bell metal	1.0052		1.45843 (589 mμ)
Borax, amorphous, fused	1.4630		1.46190 (509 mμ)
Canada balsam	1.530		1.47503 (361 mμ)
Ebonite	1.66 (red)		1.49834 (275 mμ)
Fuchsin	2.70		1.53386 (214 mμ)
Gelatin, Nelson's No. 1	1.530		1.57464 (185 mμ)
Gelatin, various	1.516–1.534	Resin, aloes	1.619 (red)
Gum Arabic	1.480 (1.514) (red)	colophony	1.548 (red)
		copal	1.528 (red)
Hoffman's violet	2.20	mastic	1.535 (red)
Ivory	1.539, 1.541	Peru balsam	1.593

INDEX OF REFRACTION OF ORGANIC COMPOUNDS

(See also that section of this book which contains data of Physical Constants of Organic Compounds)

The following table contains a list of organic compounds arranged in order of increasing refractive index. Measurements were made at 25°C.

Compound	n_D	Compound	n_D
Trifluoroacetic acid	1.283	2,2,3-Trimethylpentane	1.401
2,2,2-Trifluoroethanol	1.290	1-Chlorobutane	1.401
Octofluoropentanol-1	1.316	β-Methoxypropionitrile	1.401
Dodecafluoroheptanol-1	1.316	3-Methyl butanoic acid	1.402
Methanol	1.326	n-Nonane	1.403
Acetonitrile	1.342	Dipropylamine	1.403
Ethyl ether	1.352	Isoamylacetate	1.403
Acetone	1.357	Cyclopentane	1.404
Ethyl formate	1.358	2-Methyl-2-butanol	1.404
Ethanol	1.359	3-Methyl-1-butanol	1.404
Methyl acetate	1.360	Tetrahydrofuran	1.404
Propionitrile	1.363	Capronitrile	1.405
2,2-Dimethylbutane	1.366	2-Pentanone	1.405
Isopropyl ether	1.367	2-Ethoxyethanol	1.405
2-methylpentane	1.369	2-Heptanone	1.406
Ethyl acetate	1.370	Valeric acid	1.406
Acetic acid	1.370	Diisobutylene	1.407
Propionaldehyde	1.371	Methylcyclopentane	1.407
n-Hexane	1.372	Isoamyl ether	1.407
2,3-Dimethylbutane	1.372	Methylpropyl carbinol	1.407
3-Methylpentane	1.374	Tributyl borate	1.407
2-Propanol	1.375	1-Pentanol	1.408
Isopropyl acetate	1.375	3-Methyl-2-butanol	1.408
Propyl formate	1.375	Diethyl oxalate	1.408
2-Chloropropane	1.376	n-Decane	1.409
2-Butanone	1.377	4-Methyl-2-pentanol	1.409
2-Chloropropane	1.377	3-Isopropyl-2-pentanone	1.409
Methylethyl ketone	1.377	2-Methyl-1-butanol	1.409
Butyraldehyde	1.378	Butyric acid anhydride	1.409
2,4-Dimethylpentane	1.379	Amyl ether	1.410
Propyl ether	1.379	Isoamyl isovalerate	1.410
Acetaldehyde-diethylacetal	1.379	1-Chloropentane	1.410
Butylethyl ether	1.380	2-Propene-1-ol	1.411
Nitromethane	1.380	2,4-Dimethyl dioxane	1.412
Trifluoropropanol	1.381	Ethyl lactate	1.412
2-Methylhexane	1.382	Diethyl malonate	1.412
Butyronitrile	1.382	3-Chloropropene	1.413
Propyl acetate	1.382	Ethyleneglycol diacetate	1.413
Ethyl propionate	1.382	2-Octanone	1.414
2-Methyl-2-propanol	1.383	3-Octanone	1.414
1-Propanol	1.383	3-Methyl-2-heptanone	1.415
Isobutyl formate	1.383	Caproic acid	1.415
Diethyl carbonate	1.383	4-Methyldioxane	1.415
Heptane	1.385	1,2-Propyleneglycol-1-monobutyl ether	1.415
2-Methyl-2-propanol	1.385	Ethylcyanoacetate	1.415
Propionic acid	1.385	Dibutylamine	1.416
3-Methylhexane	1.386	2-Pentanol	1.416
n-Propyl amine	1.386	1,1-Dichloroethane	1.416
1,1-Dimethyl-2-propanone	1.386	Heptachlorodiethyl ether	1.416
1-Chloropropane	1.386	1-Hexanol	1.416
2,2,3-Trimethylbutane	1.387	1-Amino-3-methoxy propane	1.417
Methylpropyl ketone	1.387	Octyl nitrile	1.418
sec-Butyl acetate	1.387	2-Heptanol	1.418
Butyl formate	1.387	2-Propenyl amine	1.419
β-Methylpropyl ethanoate	1.388	1,2-Propyleneglycol carbonate	1.419
2,2,4-Trimethyl pentane	1.389	Methylpentyl carbinol	1.420
2,3-Dimethyl pentane	1.389	2-Ethyl-1-butanol	1.420
Acetic anhydride	1.389	1-Chloro-2-methyl-1-propene	1.420
Diisopropyl amine	1.390	p-Dioxane	1.420
2-Aminobutane	1.390	Methylcyclohexane	1.421
2-Pentanone	1.390	4-Hydroxy-4-methyl-2-pentanone	1.421
3-Pentanone	1.390	1-Heptanol	1.422
Nitroethane	1.390	3-Isopropyl-2-heptanone	1.423
Methyl-b-butyrate	1.391	Cyclohexane	1.424
Butyl acetate	1.392	2-Bromopropane	1.424
2-Nitropropane	1.392	3-Chloro-2-methylprop-1-ene	1.425
4-Methyl-2-pentanone	1.394	Caproic acid	1.426
2-Methyl-1-propanol	1.394	Glycol carbonate	1.426
Octane	1.395	1-Octanol	1.427
1-Amino-2-methylpropane	1.395	1,1-Dimethylhexanol	1.427
Valeronitrile	1.395	N,N-Dimethylformamide	1.427
2-Butanol	1.395	Sulfuric acid	1.427
2-Hexanone	1.395	1-Chlorooctane	1.428
5-Methyl-3-hexanone	1.395	Triisobutylene	1.429
2-Chlorobutane	1.395	N-Methylaniline nitrile	1.429
Butyric acid	1.396	Ethylene glycol	1.429
2,2,2-Trimethylhexane	1.397	1-Chloro-2-ethylhexane	1.430
n-Dibutyl ether	1.397	Ethylcyclohexane	1.431
1-Butanol	1.397	1,2-Propanediol	1.431
Acrolein	1.397	1-Bromopropane	1.431
1-Chloro-2-methylpropane	1.397	2-Methyl-7-ethyl-4-nonanone	1.433
Methacrylonitrile	1.398	Ethyleneglycol-mono-allyl ether	1.434
3-Methyl-2-pentanone	1.398	Butyral lactone	1.434
Triethyl amine	1.399	2-Methyl-7-ethyl-4-undecanone	1.435
n-Butyl amine	1.399	4-n-Propyl-5-ethyldioxane	1.435
1,1,3,3-Tetramethyl-2-propanone	1.399	1,2-Dichloro-2-methylpropane	1.435
Isobutyl-n-butyrate	1.399	1,2-Propyleneglycol sulfite	1.435
1-Nitropropane	1.399	N-Methylmorpholine	1.436
n-Dodecane	1.400	1-Chloro-2-methyl-2-propanol	1.436
Amyl acetate	1.400	Epichlorohydrin	1.436
1-Chlorobutane	1.400	Triethyleneglycol-mono-butyl ether	1.437
2-Methoxy ethanol	1.400	4-Ethyl-7,7,7-trimethyl-1-heptanol	1.438
Propionic acid anhydride	1.400	1-Methyl-3-ethyloctan-1-ol	1.438

INDEX OF REFRACTION OF ORGANIC COMPOUNDS (Continued)

Compound	n_D	Compound	n_D
1-Ethyl-3-ethylhexan-1-ol	1.438	Furfuralcohol	1.489
Diethyl maleate	1.438	tert-Butylcumene	1.490
1-Butanethiol	1.440	n-Propylbenzene	1.490
2-Chloroethanal	1.440	sec-Butylbenzene	1.490
Dibutyl sebacate	1.440	tert-Butylbenzene	1.490
1-Ethyl-3-ethyloctan-1-ol	1.441	Dibutylphthalate	1.490
Dimethylmaleate	1.441	tert-Butyltoluene	1.491
3-Methylpentane-2,4-diol	1.441	1-Penyl-1-oxyphenylethane	1.491
Ethyl sulfide	1.442	n-Hexylcumene	1.492
Mesityl oxide	1.442	n-Octyltoluene	1.492
Butyl stearate	1.442	n-Octylcumene	1.492
Cyclohexane	1.443	p-Xylene	1.493
1,2-Dichloroethane	1.444	1,31-Diethylbenzene	1.493
Chloroform	1.444	Ethylbenzene	1.493
trans-1,2-Dichloroethylene	1.444	1,3-Dimorpholylpropan-2-ol	1.493
Diethyleneglycol	1.445	1,12,2-Tetrachloroethane	1.493
cis-1,2-Dichloroethylene	1.445	Toluene	1.494
3-(α-Butyloctyl)-oxypropyl-1-amine	1.446	Benzylethyl ether	1.494
2-Methylmorpholine	1.446	m-Xylene	1.495
Dipropyleneglycol-monoethyl ether	1.446	1,4-Diethylbenzene	1.496
Formamide	1.446	2,3-Dichlorodioxane	1.496
3-Lauryloxypropyl-1-amine	1.447	Mesitylene	1.497
Cyclohexanone	1.448	2-Iodopropane	1.497
1-Aminopropan-1-ol	1.448	Benzene	1.498
Diethyleneglycol-mono-β-oxypropyl ether	1.448	Propyl benzoate	1.498
1-Amino-2-methylpentan-1-ol	1.449	α-Picoline	1.499
Tetrahydrofurfural alcohol	1.450	1,2-Diethylbenzene	1.501
2-Propylcyclohexa-1-one	1.452	Pentachloroethane	1.501
2-Aminoethanol	1.452	1-Iodopropane	1.502
2-Butylcyclohexan-1-one	1.453	1,2-Dimethylbenzene	1.503
Ethylenediamine	1.454	Ethyl benzoate	1.503
2-(β-Methyl)-propylcyclohexan-1-one	1.454	β-Picoline	1.504
4-Methylcyclohexanol	1.454	Tetrachloroethylene	1.504
3-Methylcyclohexanol	1.455	Phenetole	1.505
bis-2-Chloroethyl ether	1.455	Pyridine	1.507
Cyclohexylamine	1.456	Iodoethane	1.512
1,8-Cineol	1.456	Phenylmethallyl ether	1.514
2,2'-Dimethyl-2,2'-dipropyldieththanol amine	1.456	Anisole	1.515
1,1',2,2'-Tetramethyldiethanol amine	1.459	Methyl benzoate	1.515
1-Aminopropan-3-ol	1.459	Diallylphthalate	1.517
Carbon tetrachloride	1.459	Benzylacetate	1.518
3-Methyl-5-ethylheptan-2,4-diol	1.459	2-Methyl-4-tertiarybutylphenetol	1.521
2-(β-Ethyl)-butylcyclohexan-1-one	1.461	Phenylacetonitrile	1.521
2-Methylcyclohexanol	1.461	Methyl salicylate	1.522
N-(n-Butyl)-diethanol amine	1.461	Chlorobenzene	1.523
4,5-Chloro-1,3-dioxolane-2	1.461	Fufural	1.524
2-Butylcyclohexan-1-ol	1.462	Benzonitrile	1.526
N-β-Oxypropyl morpholine	1.462	Thiophene	1.526
2-(β-Ethyl)-hexylcyclohexanone	1.463	Nonachlorodiethyl ether	1.529
2-Ethylcyclohexan-1-ol	1.463	Iodomethane	1.530
Fluorobenzene	1.463	4-Phenyldioxane	1.530
d-α-Pinene	1.464	3-Phenylpropan-1-ol	1.532
l-α-Pinene	1.465	Acetophenone	1.532
Cyclohexanol	1.465	Benzyl alcohol	1.538
m-Fluorotoluene	1.465	1,2-Dibromoethane	1.538
p-Fluorotoluene	1.467	1,2,3,4-Tetrahydronaphthalene	1.539
trans-Decahydronaphthalene	1.468	m-Cresol	1.542
o-Fluorotoluene	1.468	1,3-Dichlorobenzene	1.543
3-Alloxy-2-oxypropylamine-1	1.469	Benzaldehyde	1.544
Ethanol-1-methylisopropanol amine	1.470	Styrene	1.545
d-Limonene	1.471	Nitrobenzene	1.550
1,2,3-Trichloroisobutane	1.473	o-Dichlorobenzene	1.551
Decahydronaphthalene	1.474	Bromobenzene	1.557
1,2,3-Propanetriol	1.474	o-Nitroanisole	1.560
Trichloroethylene	1.475	m-Toluidine	1.566
N-β-Oxyethylmorpholine	1.476	Benzyl benzoate	1.568
Dimethylsulfoxide	1.476	o-Toluidine	1.570
cis-Decahydronaphthalene	1.479	1-Methoxyphenyl-1-phenyl-ethane	1.571
N-β-Chlorallylmorpholine	1.481	Aniline	1.583
n-Dodecyl-4-tertiarybutylphenyl ether	1.482	o-Chloroaniline	1.586
n-Dodecylphenyl ether	1.482	Bromoform	1.587
n-Dodecyl-4-methylphenyl ether	1.483	Benzenethiol	1.588
2-Ethylidene cyclohexanone	1.486	2,4-Bis(β-phenylethyl)-phenylmethyl ether	1.590
n-Butylbenzene	1.487	Carbondisulfide	1.628
p-Cymene	1.488	1,12,2-Tetrabromomethane	1.633
iso-Propylbenzene	1.489	Diiodomethane	1.749

MOLAR REFRACTION OF ORGANIC COMPOUNDS

The molar refraction, R, is defined as:

$$R = \left(\frac{n^2 - 1}{n^2 + 2}\right)\left(\frac{M}{d}\right)$$

where n = refractive index; M = molecular weight; d = density in grams per cm^3; and (M/d) is the volume occupied by 1 gram molecular weight of the compound. The units of R will then be cm^{-3}.

R is, to a first approximation, independent of temperature or physical state, and it provides an approximate measure of the actual total volume (without free space) of the molecules in one gram mole.

For a very large number of compounds R is approximately additive for the bonds present in the molecule. Using R_D based on n_D (sodium light), the following atomic, group and structural contributions to R_D are based on Vogel's extensive modern measurements published in the Journal of the Chemical Society, 1948.

C	2.591	Cl	5.844	=S	7.921
H	1.028	Br	8.741	C≡N	5.459
=O	2.122	I	13.954	N (primary aliphatic)	2.376
\O/	1.643	C_6H_5	25.463	N (secondary aliphatic)	2.582
OH	2.553	$C_{10}H_7$	43.00		
F	0.81	\S/	7.729		
Ethylenic bond	1.575	Four membered ring	0.317		
Acetylenic bond	1.977	Three membered ring	0.614		
N (aromatic)	3.550				

Example:—For C_2H_5COOH: $R_{calc.} = 3(2.591) + 5(1.028) + 2.122 + 2.553 = 17.588$
$R_{obs.}$ for this compound is 17.51
For $C_6H_5NHCH_3$: $R_{calc.} = 25.463 + 3.550 + 2.591 + 4(1.028) = 35.716$
$R_{obs.}$ for this compound is 35.67

INDEX OF REFRACTION OF WATER

Alcohol and Carbon Bisulfide
For sodium light, λ = .5893

Temp. °C	Water, pure relative to air	Ethyl Alcohol 99.8 relative to air	Carbon Bisulfide relative to air

INDEX OF REFRACTION OF AIR (15°C, 76 cm Hg)

Corrections for reducing wavelengths and frequencies in air (15°C, 76 cm Hg) to vacuo

The indices were computed from the Cauchy formula $(n-1)10^7 = 2726.43 + 12.288/(\lambda^2 \times 10^{-8}) + 0.3555/(\lambda^4 \times 10^{-16})$. For 0°C and 76 cm Hg the constants of the equation become 2875.66, 13.412 and 0.3777 respectively, and for 30°C and 76 cm Hg 2589.72, 12.259 and 0.2576. Sellmeier's formula for but one absorption band closely fits the observations: $n^2 = 1 + 0.00057378\lambda^2/(\lambda^2 - 595260)$. If $n-1$ were strictly proportional to the density, then $(n-1)_0/(n-1)t$ would equal $1 + \alpha t$ where α should be 0.00367. The following values of α were found to hold:

λ	0.85μ	0.75μ	0.65μ	0.55μ	0.45μ	0.35μ	0.25μ
α	0.003672	0.003674	0.003678	0.003685	0.003700	0.003738	0.003872

The indices are for dry air (0.05 ± % CO_2). Corrections to reduce to dry air the indices for moist air may be made for any wavelength by Lorenz's formula, $+0.000041(m/760)$, where m is the vapor pressure in mm. The corresponding frequencies in waves per cm and the corrections to reduce wavelengths and frequencies in air at 15°C and 76 cm Hg pressure to vacuo are given. E.g., a light wave of 5000 angstroms in dry air at 15°C, 76 cm Hg becomes 5001.391 A in vacuo; a frequency of 20.000 waves per cm correspondingly becomes 19994.44.

Wavelength, λ angstroms	Dry air $(n-1)\times 10^7$ 15°C 76 cm Hg	Vacuo correction for λ in air $(n\lambda - \lambda)$ add	Frequency waves per cm $\frac{1}{\lambda}$ in air	Vacuo correction for $\frac{1}{\lambda}$ in air $\left(\frac{1}{n\lambda} - \frac{1}{\lambda}\right)$ subtract	Wavelength, λ angstroms	Dry air $(n-1)\times 10^7$ 15°C 76 cm Hg	Vacuo correction for λ in air $(n\lambda - \lambda)$ add	Frequency waves per cm $\frac{1}{\lambda}$ in air	Vacuo correction for $\frac{1}{\lambda}$ in air $\left(\frac{1}{n\lambda} - \frac{1}{\lambda}\right)$ subtract

INDEX OF REFRACTION OF AQUEOUS SOLUTIONS OF SUCROSE (CANE SUGAR) (Continued)

TEMPERATURE CORRECTIONS

Below 20°C the correction should be subtracted from the per cent sugar. Above 20°C the correction is to be added to the per cent sugar.

Temp. °C	Approximate per cent sugar									
	5	10	15	20	30	40	50	60	70	75

INDEX OF REFRACTION OF MALTOSE HYDRATE SOLUTIONS

McDonald: Journal of Research of the National Bureau of Standards, Vol. **46**, 165, 1951

The following table gives the refractive index of maltose solutions for $\lambda = 5893$ A at 20° and 25°C.

Percent	n_D^{20}	n_D^{25}	Δn	$\Delta n/\Delta t$
1	1.33438	1.33389	0.00049	0.00010
2	1.33579	1.33528	.00051	.00010

Spectral Emissivity of Oxides

The emissivity of oxides and oxidized metals depends to a large extent upon the roughness of the surface. In general, higher values of emissivity are obtained on the rougher surfaces.

Material	Range of observed values	Probable value for oxide formed on smooth metal	Material	Range of observed values	Probable value for oxide formed on smooth metal
Aluminum oxide	0.22–0.40	0.30	Alumel (oxidized)		0.87

TRANSMISSION OF COLORED GLASSES

If I_o is the intensity of radiation entering a layer of some medium and I the intensity reaching the opposite surface, the ratio I/I_o is called the transmittance. In practice the ratio of intensity of radiation passing through a glass sample to that incident on its surface is often measured and plotted as transmission. The transmission is the result of two factors, the transmittance of the glass and the losses by reflection. These losses amount to about 4 % for each glass-air surface; the transmission of a sample is about 92 % of its transmittance. Since the reflection losses differ slightly with different samples, the correction is often determined and applied when the transmission is measured. Values which are thus corrected are marked * at the head of the column.

In order to obtain the transmittance for thicknesses other than those listed it is convenient to transform the tabular values to terms of βt in the equation $I/I_o = e^{\beta t}$ where t is the thickness (in millimeters) and β a constant for a particular sample. The base 10 is conveniently used in place of e so that βt becomes the common logarithm of the transmittance, or $\beta t = \log I/I_o$. Using the corrected value of the transmittance for a specific thickness, found in the table, the value of βt may be found, changed to the value for the new thickness and the transmittance for the second thickness computed.

For example: The tabular value of transmission for sample **CG** 396 at $\lambda = .46\mu$ is given as 0.80 for a thickness of 2 mm. It is desired to find the transmittance for 5 mm.

The corrected value of the transmittance for 2 mm is 0.80/.92 or about 0.871. Log .871 = 9.94002–10. Writing this as a wholly negative number the equation becomes $\beta t = -.05998$. For $t = 5$ $\beta t = -.05998 \times 5/2 = -.14995$ or changing to the more familiar form gives 9.85005–10 which is the logarithm of the new transmittance which is found to be .708. The transmission will be .92 × .708 or .651.

In order to identify the glasses listed, the manufacturer's number is given preceded by an abbreviation of the maker's name, as follows: **AO**, American Optical Co.; **BL**, Bausch & Lomb Optical Co.; **CE**, Chicago Eye Shield Co.; **CG**, Corning Glass Works. Data for Jena glasses are given separately in section II of the table.

This table has been compiled with the assistance of: Mr. H. P. Gage, Corning Glass Works; Mr. J. Liautaud, Chicago Eye Shield Co.; Mr. W. B. Rayton, Bausch & Lomb Optical Co.; Mr. A. J. Weinstein of the Fish-Shurman Corporation.

TRANSMISSION OF WRATTEN FILTERS

Compiled by Allie C. Peed, Jr. for The Eastman Kodak Company

Data condensed from Kodak Wratten Filters for Scientific and Technical Use published by the Eastman Kodak Company, manufacturers of the filters.

The following pages give (1) percentage luminous transmittance at wave lengths from 400 to 700μ at intervals of 10μ for the standard illuminant "C" adopted by the International Commission of Illumination, (2) dominant wave length in millimicrons, and (3) percentage of excitation purity. Values of wave length followed by "c" indicate the complementary wave lengths of purple filters which do not have a dominant wave length.

All colorimetric specifications are based on the 1931 standard ICI colorimetric and luminosity data.

The transmittance data are given as representing standard samples of the filters. They are intended only for the information of users in choosing filters which will meet their requirements. Values taken from the tables of data should not be used by research workers as representing precisely the absorption characteristics of a particular filter. If such precise data are needed, they should be determined for the particular filter being used.

Where the spectra extend into the ultraviolet this fact is indicated by an asterisk (*) in the transmission tables immediately beneath the filter number, and quantitative data are not given. The manufacturer should be consulted for this information. Transmission in the ultraviolet of wave lengths less than 330μ will be eliminated in the case of cemented filters, as glass absorbs ultraviolet radiation of wave lengths shorter than about 330μ.

Stability ratings are given as three letter combinations following the filter description in the table below. In establishing the stability classifications each filter is exposed to a selected light source for a specific time interval. The following grading system is used to describe the result:

Class A—stable
Class B—relatively stable
Class C—somewhat unstable
Class D—unstable

The classification letters, for example, AAA, describe the stability to the following three exposure tests in this order:

1. Two weeks' exposure to daylight in a south window
2. Twenty-four hours' exposure to a "Fade-Ometer"
3. Two weeks' exposure at two feet from a 1000-watt tungsten lamp.

Filters are supplied in two forms; as lacquered gelatin film, or as a gelatin film cemented between pieces of optical glass. Filters in glass are cemented between sheets of plane-parallel glass, which is surfaced in quantities and is of sufficient accuracy for general photographic work, and for most scientific purposes.

Most Wratten Gelatin Filters are stocked in 2- or 3-inch squares. Stocks of 2- or 3-inch square filters cemented in glass are maintained only in filters usually used for general photographic work.

The booklet "Kodak Filters and Lens Attachments" gives more valuable information on this subject.

FILTER DATA

No.	Description, use, and stability
	Colorless
0	For compensating thickness of other gelatin filters in optical systems, AAA.
1	Absorbs ultraviolet below 360 mμ, DDD.
1A	Kodak Skylight Filter—Reduces excess bluishness in outdoor color photographs in open shade under a clear, blue sky, ACA.
	Yellows
2B	Absorbs ultraviolet below 410 mμ, ACA.
3	Light yellow, CCD.
3N5	No. 3 plus 0.5 neutral density, AAA.
4	Light yellow—Approximate correction on panchromatic materials for outdoor scenes, including sky, CCC.
6	K1—Light yellow—Partial correction outdoors, BBA.
8	K2—Yellow—Full correction outdoors on Type B panchromatic materials. Widely used for proper sky, cloud, and foliage rendering. Green separation for Fluorescence Process, AAA.
8N5	No. 8 plus 0.5 neutral density, AAA.
9	K3—Deep yellow. Moderate contrast in outdoor photography (with black-and-white films), AAA.
11	X1—Greenish yellow. Correction for tungsten light on Type B panchromatic materials; also for daylight correction with Type C panchromatic materials in making outdoor portraits, darkening skies, or lightening foliage, AAA.
12	Minus blue. Haze cutting in aerial photography, AAA.
13	X2—Yellow green. Correction for Type C panchromatic materials in tungsten light, ABA.
15	G—Deep yellow. Overcorrection in landscape photography. Contrast control in copying and in aerial infrared photography, AAA.
16	Blue absorption, AAB.
18A	Transmits ultraviolet and infrared only (glass), AAA.
	Oranges and Reds
21	Blue and blue-green absorption, CBB.
22	Yellow-orange. For increasing contrast in blue preparations in microscopy. Mercury yellow, BAC.
23A	Light red. Two-color projection—contrast effects, BAB.
24	Red for two-color photography (daylight or tungsten). White-flame-arc tricolor projection, AAB.
25	A—Tricolor red for direct color separation. Contrast effects in commercial photography and in outdoor scenes. Two-color general viewing. Aerial infrared photography and haze cutting, AAA.
26	Stereo red, AAA.
29	Red color separation from transparencies and for the Kodak Fluorescence Process. Strong contrast effects. Copying blueprints. Tungsten tricolor projection, AAA.
	Magentas and Violets
30	Green absorption, BBC.
31	Green absorption, CCA.
32	Minus green, CCD.
33	Strong green absorption, CCB.
34	Violet, CDD.
34A	Blue separation—Kodak Fluorescence Process, DCC.
35	Contrast in microscopy, CDD.
36	Dark violet, CCC.
	Blues and Blue-greens
38	Red absorption, BCA.
38A	Red absorption. Increasing contrast in visual microscopy, BBB.
39	Contrast control in printing motion-picture duplicates (glass), AAA.
40	Green for two-color photography (tungsten), CBC.
44	Minus red—Two-color general viewing, DDD.
44A	Minus red, DDD.
45	Contrast in microscopy, DDD.
45A	Highest resolving power in visual microscopy, CDC.
46	Blue projection (experimental), DDD.
47	Tricolor blue for direct color separation and from Kodak Ektacolor Film for Dye Transfer. Contrast effects in commercial photography. Tungsten and white-flame-arc tricolor projection, BBC.
47B	Tricolor blue for color separation from transparencies and from Kodak Ektacolor Film for Graphic Arts, BBB.
48	Green and red absorption, CBC.
48A	Green and red absorption, AAB.
49	Dark blue, BCB.
49B	Very dark blue, BBB.
50	Very dark blue. Mercury violet, CCC.
	Greens
52	Light green, AAB.
53	Medium green, CCB.
54	Very dark green, AAA.
55	Stereo green, BBC.
56	Very light green, CBC.

TRANSMISSION OF WRATTEN FILTERS (Continued)

FILTER DATA

No.	Description, use, and stability
	Greens (Continued)
57	Green for two-color photography (daylight), CBC.
57A	Light green, BBC.
58	Tricolor green for direct color separation. Contrast effects in commercial photography and microscopy, BBC.
59	Green for tricolor projection (white-flame-arc), BBB.
59A	Very light green, BBB.
60	Green for two-color photography (tungsten), BDC.
61	Green color separation from transparencies and Kodak Ekta-color Film. Tricolor projection (tungsten), ABC.
64	Red absorption (light), CDB.
65	Red absorption, ADB.
65A	Red absorption, CCD.
66	Contrast effects in microscopy and medical photography, DDC.
67A	Red absorption (light). Two-color projection, CDC.
	Narrow-band
70	Dark red. Infrared photography. Color separation for Kodak Ektacolor Film (with tungsten), ABC.
72B	Dark orange-yellow, CCC.
73	Dark yellow-green, ABB.
74	Dark green. Mercury green, BBC.
75	Dark blue-green, ACC.
76	Dark violet (compound filter), DDD.
77	Transmits 546 mμ mercury line (glass plus gelatin), AAA.
77A	Transmits 546 mμ mercury line (glass plus gelatin), AAA.
	Photometrics
78	Bluish. Photometric filter (visual), BAB.
78AA	Bluish. Photometric filter (visual), BAA.
78A	Bluish. Photometric filter (visual), AAA.
78B	Bluish. Photometric filter (visual), AAA.
78C	Bluish. Photometric filter (visual), BAA.
86	Yellowish. Photometric filter (visual), BBA.
86A	Yellowish. Photometric filter (visual), AAA.
†86B	Yellowish. Photometric filter (visual), BCA.
†86C	Yellowish. Photometric filter (visual), AAA.

No.	Description, use, and stability
	Light Balancing
80A	For Kodachrome Film, Daylight Type, and photographic flood lamps, ABA.
81	Yellowish. For warmer color rendering.
81A	Yellowish. For Kodak Ektachrome Film, Type B, with photographic flood lamps.
81B	Yellowish. For warmer color rendering.
81C	Yellowish. For Kodachrome Film, Type A, with flash lamps.
81D	Yellowish. For Kodachrome Film, Type A, with flash lamps.
81EF	Yellowish. For Kodak Ektachrome Film, Type B, with flash lamps.
82	Bluish. For cooler color rendering.
82A	Bluish. For Kodachrome Film, Type A, with 3200 K lamps.
82B	Bluish. For cooler color rendering.
82C	Bluish. For cooler color rendering.
83	Yellowish. For 16 mm Commercial Kodachrome Film and daylight exposure, BBB.
85	Orange. For Type A Kodak color films and daylight exposure, BAA.
85B	Orange. For Kodak Ektachrome Film, Type B, and daylight exposure, BAB.
	Miscellaneous
79	Photographic sensitometry. Corrects 2360 K to 5500 K, AAA.
87	For infrared photography. Absorbs visual.
87C	Absorbs visual, transmits infrared.
88A	For infrared photography. Absorbs visual.
89B	For infrared photography, AAA.
90	Narrow-band viewing filter for judging brightness scale of scenes, CCD.
96	Neutral filters for controlling luminance, AAB.
97	Dichroic absorption, AAA.
102	Correction filter for Barrier-layer photocell, ABA.
106	Correction filter for S-4 type photocell, AAA.

Ratio of the transmitted light to the incident light for a definite thickness of the substance, usually 1 cm.

Glass.

Glass in general is opaque to the ultra-violet and infra-red. Uviol glass is transparent to the longer radiations of the ultra-violet

Coefficient of transparency of glass for visible and ultra-violet radiations.

	Normal incidence, thickness 1 cm.

Quartz

Quartz is very transparent to the ultra-violet and to the visible spectrum, but opaque for the infra-red beyond 7.0μ.

(Pflüger.)

Wave length, microns.....	0.19	0.20	0.21	0.22
Transmission for 1 mm.....	.67	.84	.92	.94

Fluorite

Fluorite is very transparent to the ultra-violet, nearly to 0.10μ. Coefficient of transparency at $\lambda = 186$ is found by Pflüger to be 0.80.

For the infra-red the values are given in a table below.

Rock Salt and Sylvine and Fluorite

Transparency for the Infra-red.

COLORIMETRY

Selected from Judd, Jour. Opt. Soc. Amer. **23,** 359 (1933)

Recommendations of the International Commission on Illumination

Standard Illuminants

A. Gas-filled tungsten incandescent lamp of color temperature 2848° K.

B. Noon Sunlight. Lamp as above in combination with the Davis-Gibson filter for converting color temperature 2848° to 4800° K.

The filter is to be composed of a layer one centimeter thick of each of two separate solutions B_1 and B_2, contained in a double cell of colorless optical glass.

Solution B_1

Copper sulfate ($CuSO_4 \cdot 5H_2O$)	2.452	g
Mannite ($C_6H_8(OH)_6$)	2.452	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution B_2

Cobalt ammonium sulfate ($CoSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$)	21.71	g
Copper sulfate ($CuSO_4 \cdot 5H_2O$)	16.11	g
Sulfuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

C. Average Daylight. Lamp as in **A** in combination with Davis-Gibson filter for converting color temperature 2848° to 6500° K.

The filter is composed of a layer one centimeter thick of each of two separate solutions C_1 and C_2, contained in a double cell made of colorless optical glass.

Solution C_1

Copper sulfate ($CuSO_4 \cdot 5H_2O$)	3.412	g
Mannite ($C_6H_8(OH)_6$)	3.412	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution C_2

Cobalt ammonium sulfate ($CoSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$)	30.580	g
Copper sulfate ($CuSO_4 \cdot 5H_2O$)	22.520	g
Sulfuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

See R. Davis and K. S. Gibson Bur. Stds. Misc. Pub. No. 114, Jan. 1931 or Bur. Stds. Jour. Research **7,** 796 (1931).

Standard Coordinate System

The tristimulus system of color specification is based on four chosen stimuli consisting of homogeneous radiant energy of wave lengths

700.0 **546.1** **435.8**

mμ and of standard illuminant B (see above).

To establish the system of specification coordinates are assigned as follows:

Stimulus	x	y	z
700.0 mμ	0.73467	0.26533	0.00000
546.1 mμ	0.27376	0.71741	0.00883
435.8 mμ	0.16658	0.00886	0.82456
Standard illuminant B:	0.34842	0.35161	0.29997

The Standard Observer

The "standard observer" is determined below by the specification for the equal energy spectrum both in fractions, x, y, z of the total amount for each wave length interval of 5 mμ and directly $\bar{x}, \bar{y}, \bar{z}$. The fractional values are known as the **trilinear coordinates** or **trichromatic coefficients** of the spectrum; the direct values as the **distribution functions** or coefficients.

The sum of the trichromatic coefficients is unity, that is $x + y + z = 1$. Therefore the value of z may be and often is omitted from a specification.

Relative Visibility

The value of $\bar{y}$ given in the table is the standard visibility function or relative visibility.

Wave length mμ	Trichromatic coefficients			Distribution coefficients for equal energy			Wave length mμ

SPECIFIC ROTATION

Specific rotation or rotatory power is given in degrees per decimeter for liquids and solutions and in degrees per millimeter for solids; + signifies right handed rotation, − left. Specific rotation varies with the wave length of light used, with temperature and, in the case of solutions, with the concentration. When sodium light is used, indicated by D in the wave length column, a value of $\lambda = 0.5893$ may be assumed.

Optical rotatory power for a large number of organic compounds will be found in the International Critical Tables, Vol. VII; for sugars, Vol. II.

Solids

Substance	Wave length μ	Rotation deg./mm	Substance	Wave length μ	Rotation deg./mm

Menthol	35.2	D	− 49.7
Nicotine $C_{10}H_{14}N_2$	10–30	D	−162
	20	0.6563	−126
	20	0.5351	−207.5
	20	0.4861	−253.5
Turpentine $C_{10}H_{16}$	20	D	− 37
	20	0.6563	− 29.5
	20	0.5351	− 45
	20	0.4861	− 54.5

Solutions

Corrections for values of the specific rotation for concentration are given in the last column. c indicates concentration in grams per 100 milliliters of solution; d indicates the concentration in grams per 100 grams of solution.

Substance	Solvent	Temp. °C	Wave length μ	Specific rotation deg./dm	Correction for concentration or temperature
Albumen	water	..	D	− 25 to −38	
Arabinose	water	20	D	− 105.0	
Camphor	alcohol	20	D	+ 54.4 − .135d	for d = 45–91
	benzene	20	D	+ 56 − .166d	for d = 47–90
	ether	..	D	+ 57	
Dextrose d-glucose $C_6H_{12}O_6$	water	20	D	+ 52.5 + .025d	for d = 1–18
			.5461	+ 62.03 + .04257c	for c = 6–32
Galactose	water	..	D	+ 83.9 + .078d − .21t	for d = 4–36 and t = 10–30°C
l-Glucose (β)	water	20	D	− 51.4	
Invert sugar $C_6H_{12}O_6$	water	20	D	− 19.7 − .036c	for c = 9–35
				$a_t = a_{20} + .304(t - 20) + .00165(t - 20)^2$	for t = 3–30°C
		25	5461	− 21.5	
Lactose	water	20	D	+ 52.4 + .072 (20° − t)	for c = 5
			.5461	+ 61.9 + .085(20° − t)	for c = 5
Levulose fruit sugar	water	25	D	− 88.5 − .145d	for d = 2.6–18.6
		25	.5461	− 105.30

Strychnine	$C_{21}H_{22}N_2O_2$	C_2H_5OH	0.9	−128

* Varies greatly with temperature, solvent, and conc.

MAGNETIC ROTATORY POWER

The rotation of the plane of polarization of light by transparent substances subjected to a magnetic field may be applied to problems of molecular structure. This rotatory effect is known as the Faraday effect. Investigations of this effect by E. Verdet showed the angle of rotation (α) to depend on the nature of the substance and to be proportional to the length (l) of the column of the substance which the light traverses and to the strength (H) of the magnetic field. Thus

$$\alpha = \Lambda l H$$

where Λ is the Verdet constant for the experimental material. Other symbols in the table have the following significance:

λ = Wavelength in μ
t = Degrees centigrade
ρ_M = Molecular magnetic rotation of the substance under consideration compared to that of water determined in the same apparatus in the same magnetic field.

Thus

$$\rho_M = M'\alpha'\rho'/M'\alpha'\rho$$

where M is the molecular weight, α the angle of rotation and ρ the density of the given substance, and M', α', and ρ' are the same quantities of water.

$[\lambda]_M^{\lambda,t}$ = Molecular rotatory value of the substance at the given temperature and at the wavelength λ. Values are in (radians)(gauss^{-1})(cm^{-1}).

$\Lambda^{\lambda,t}$ = Verdet constant at the temperature t and at the wavelength λ. Values are in (minutes)(gauss^{-1})(cm^{-1}).

Values in this table are reproduced by permission from Volume 3, Tables de Constantes et Donnees Nuimeriques, "Pouvoir Rotatorie Magnetique, Effet Magneto-Optique de Kerr."

A much greater listing of values for both organic and inorganic compounds is in the above publication.

TRANSPARENCY TO OPTICAL DENSITY CONVERSION TABLE

Transparency of a layer of material is defined as the ratio of the intensity of the transmitted light to that of the incident light. Opacity is the reciprocal of the transparency. Optical density is the common logarithm of the opacity.

Thus,

$$\text{Transparency} = \frac{I_t}{I_i}$$

$$\text{Opacity} = \frac{1}{\text{Transparency}} = \frac{I_i}{I_t}$$

$$\text{Optical density} = \log_{10}\left(\frac{I_i}{I_t}\right)$$

where I_i = Intensity of incident light
I_t = Intensity of transmitted light.

DENSITY OF VARIOUS SOLIDS

The approximate density of various solids at ordinary atmospheric temperature.

In the case of substances with voids such as paper or leather the bulk density is indicated rather than the density of the solid portion.

(Selected principally from the Smithsonian Tables.)

DENSITY OF WATER

The temperature of maximum density for pure water, free from air = **3.98**°C.

The density at this temperature = **0.999973** g/cm³.

The density of water at 3.98° C is 1.000000 g/ml.

(International Bureau of Weights and Measures, 1910.)

WEIGHT OF 1 GALLON OF WATER

The weights in air are for dry air at the same temperature as the water up to 40°C. and at a (corrected) barometric pressure of 760 mm and against brass weights of 8.4 density at 0°C. Above 40°C. the temperature of the air is assumed to be 20°C., i. e., the water is allowed to cool to 20°C. before the weighings are made. The volumetric computations are based on the relation that 1 liter = 1.000027 cubic decimeters and 1 cubic decimeter = 61.023378 cubic inches.

TEMPERATURE CORRECTION FOR VOLUMETRIC SOLUTIONS

This table gives the correction to various observed volumes of water, measured at the designated temperatures to give the volume at the standard temperature, 20°C. Conversely, by subtracting the corrections from the volume desired at 20°C., the volume that must be measured out at the designated temperatures in order to give the desired volume at 20°C., will be obtained. It is assumed that the volumes are measured in glass apparatus having a coefficient of cubical expansion of 0.000025 per degree centigrade. The table is applicable to dilute aqueous solutions having the same coefficient of expansion as water.

Temperature of measurement, °C.	Capacity of apparatus in milliliters at 20°C.							Temperature of measurement, °C.	Capacity of apparatus in milliliters at 20°C.						
	2,000	1,000	500	400	300	250	150		2,000	1,000	500	400	300	250	150
	Correction in milliliters to give volume of water at 20°C.								Correction in milliliters to give volume of water at 20°C.						
15	+1.54	+0.77	+0.38	+0.31	+0.23	+0.19	+0 12	23	−1.18	− .59	− .30	− .24	− .18	− .15	− .09
16	+1.28	+ .64	+ .32	+ .26	+ .19	+ .16	+ .10	24	−1 61	− .81	− .40	− .32	− .24	− .20	− .12
17	+ .99	+ .50	+ .25	+ .20	+ .15	+ .12	+ .07	25	−2 07	−1 03	− .52	− .41	− .31	− .26	− .15

19	+ .35	+ .18	+ .09	+ .07	+ .05	+ .04	+ .03	27	−3 03	−1 52	− .76	− .61	− .46	− .38	− .23
								28	−3 55	−1 77	− .89	− .71	− .53	− .44	− .27
21	− .37	− .18	− .09	− .07	− .06	− .05	− .03	29	−4 08	−2 04	−1.02	− .82	− .61	− .51	− .31
22	− .77	− .38	− .19	− .15	− .12	− .10	− .06	30	−4.62	−2.31	−1.16	− .92	− .69	− .58	− .35

In using the above table to correct the volume of certain standard solutions to 20°C. more accurate results will be obtained if the numerical values of the corrections are increased by the percentages given below:

Solution	Normality		
	N	N/2	N/10
HNO_3	50	25	6
H_2SO_4	45	25	5
NaOH	40	25	5
KOH	40	20	4

TEMPERATURE CORRECTION FOR GLASS VOLUMETRIC APPARATUS

This table gives the correction to be added to actual capacity (determined at certain temperatures) to give the capacity at the standard temperature, 20°C. Conversely, by subtracting the corrections from the indicated capacity of an instrument standard at 20°C. the corresponding capacity at other temperatures is obtained. The table assumes for the cubical coefficient of expansion of glass 0.000025 per degree centigrade. The coefficients of expansion of glasses used for volumetric instruments vary from 0.000023 to 0.000028.

HYDROMETERS AND DENSITY UNITS

Alcoholometer. — For testing alcoholic solutions; the scale shows the per cent of alcohol by volume; 0°–100° is the per cent.

Ammoniameter. — For testing ammonia solutions; scale 0°–40°; to convert to sp. gr. multiply by 3 and deduct from 1000.

Barktrometer or *Barkometer.* — For testing tanning liquor; scale 0°–80° Bk; the number to the right of the decimal point of the sp. gr. is the degree Bk; thus, 1.025 sp. gr. is 25° Bk.

Baumé. — There are two kinds in use; heavy Bé, for liquids heavier than water and light Bé for liquids lighter than water. In the former, 0° corresponds to a sp. gr. 1.000 (water at 4°C.) and 66° corresponds to a sp. gr. 1.842; in the lighter than water scale, 0° Bé is equivalent to the gravity of a 10% solution of sodium chloride and 60° Bé corresponds to a sp. gr. of 0.745. For Baumé degrees on the scale of densities greater than unity, the following equation gives the means of conversion:

$$\text{Sp. gr.} = \frac{m}{m - d}$$

where m = 145 (in the United States)
m = 144 (old scale used in Holland)
m = 146.78 (New scale or Gerlach scale)
d = Baumé reading

Beck's Hydrometer has 0° corresponding to sp. gr. 1.000 and 30° to sp. gr. 0.850; equal divisions on the scale are continued as far as required in both directions.

Brix Saccharometer or *Balling Saccharometer* shows directly the per cent of sugar (sucrose) by weight at the temperature indicated on the instrument, usually 17.5°C.; i.e., degrees Brix is the per cent sugar.

Cartier's Hydrometer floats in water at the 10° scale division and at 30° corresponds to 32° Bé.

Oleometer.—For vegetable and sperm oils; scale 50°–0° corresponds to sp. gr. 0.870–0.970.

Soxhlet's Lactometer, for determining the density of milk, has a scale from 25° (sp. gr. 1.025) to 35° (sp. gr. 1.035) divided into suitable scale divisions.

Twaddell Hydrometers have the scale so arranged that the reading multiplied by 5 and added to 1000 gives the sp. gr. with reference to water as 1000; it is always used for densities greater than water.

DENSITY OF MOIST AIR

The density of dry air may be determined by computation from the general relation $D = D_0(T_0/T)(P/P_0)$ where D_0 represents a known density at absolute temperature T_0 and pressure P_0 and D, the density at absolute temperature T and pressure P.

The density of **moist** air may be determined by a similar relation:

$D = 1.2929\ (273.13/T)\ [(B - 0.3783e)/760]$ where T is the absolute temperature; B, the barometric pressure in mm, and e the vapor pressure of the moisture in the air in mm. The density will then be the product of two terms, each of which may be found by use of the tables which follow.

The **first factor,** $1.2929\ (273.13/T)$, may be found directly in Table I for various temperatures. For convenience, temperatures are given in the table in °C although the values of the factor have been computed with absolute temperatures. The tabular values actually represent the density of dry air at various temperatures and 760 mm pressure.

The **second factor,** $[(B - 0.3783e)/760]$, must be obtained in two steps: **First**—the numerator of the expression is obtained by subtracting $0.3783e$ from the barometric pressure. The quantity $0.3783e$ may be found directly from the dew point in Table II. If the wet and dry bulb thermometer readings are known e may be found in the table Reduction of Psychrometric Observations given in the section Hygrometric and Barometric Tables. $0.3783e$ may then be found by calculation or read from the table. **Second**—the value of the whole factor for any value of $B - 0.3783e$ may be obtained from Table III.

The product of the above two factors will give the required density in g/l.

To facilitate obtaining **approximate values** of the density for ordinary pressures and temperatures, a table of products is given which may be entered with the temperature in °C and the corrected (for moisture) value of the barometric pressure in mm to obtain density.

As an illustration of the use of the tables, let it be desired to find the density of air for a barometric pressure of 750 mm, a dew point of 10° C, and air temperature of 20° C.

From the dew point, the value of $0.3783e$ is found in Table II to be 3.48 mm. $750 - 3.48 = 746.52$, the corrected pressure. The pressure factor for this value found in Table III by interpolation is 0.98226.

The temperature factor from Table I is 1.2047.

$$1.2047 \times 0.98224 = 1.1833\ \text{g/l}.$$

To obtain the value directly from Table IV, enter it for 20° C and 746.5 mm which gives by interpolation 1.183 g/l.

TABLE I

$(1.2929 \times 273.13/T)$

(Besides being a necessary part of the determination of the density of moist air, the values in this table are actually the density of dry air in g/l at 760 mm pressure for various temperatures.)

TABLE III

Pressure Factor.—$[(B - 0.3783e)/760]$

The figures in the body of the table give values of the whole term $(B - 0.3783e)/760]$ for various values of the numerator $(B - 0.3783e)$ expressed at the left and top.

TABLE IV

Density of Moist Air

Values in the body of the table give the density of moist air in g/l for a limited range of temperatures and corrected pressure values ($B - 0.3783e$). The latter may be obtained by use of Table II.

DENSITY OF DRY AIR

At the Temperature t, and under the Pressure H cm of Mercury the Density of Air

$$= \frac{0.001293}{1+0.00367\,t} \frac{H}{76}.$$

Units of this table are grams per milliliter
(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

ISOTHERMAL COMPRESSIBILITY OF LIQUIDS

Compiled by John C. McGowan

The figures in this table are for isothermal compressibilities in c.g.s. units. The compiler suggests, that provided the pressure is not too high, the reciprocal of the isothermal compressibility varies linearly with the pressure. This suggestion also appears in papers by J. R. Macdonald, Reviews of Modern Physics 38, 669, (1966) and O. L. Anderson, J. Phys. Chem. Solids 27, 547, (1966). The papers vary somewhat as to how far this linearity persists.

COEFFICIENT OF FRICTION

Compiled by Harold Minshall

The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the total force pressing the two together.

If F is the force required to move one surface over another and W, the force pressing the surfaces together, the coefficient of friction,

$$\mu = \frac{F}{W}$$

[2] Hemispherical steel slider having 0.6 cm. diameter. The thin, 10^{-3} to 10^{-4} cm., thin metallic films were deposited on various substrates as indicated. Amonton's Law is not obeyed in this case.

[3] The metals which were spectrosopically pure were outgassed in a vacuum prior to other gases being admitted. When clean and in vacuum there is gross seizure.

" " "	100m/min on bitumen, clean	—	1.07
" " "	100m/min " " , wetted with water	—	0.95
" " "	100m/min on rubber flooring or rubber tread vulcanisate, clean	—	1.16
" " "	100m/min on bitumen containing rubber powder, clean	—	1.15 (varies with quantity of powder)
" " "	100m/min on bitumen containing rubber powder, wetted with water	—	1.03

[1] Registered trade name. [3] The metals which were spectroscopically pure were outgassed in a vacuum prior to other gases being admitted. When clean and in vacuum there is gross seizure.

HARDNESS OF MATERIALS

Agate	6–7	Indium	1.2
Alabaster	1.7	Iridium	6–6.5
Alum	2–2.5	Iridosmium	7
Aluminum	2–2.9	Iron	4–5
Alundum	9+	Kaolinite	2.0–2.5
Amber	2–2.5	Lead	1.5
Andalusite	7.5	Lithium	0.6
Anthracite	2.2	Loess (0°)	0.3
Antimony	3.0–3.3	Magnesium	2.0
Apatite	5	Magnetite	6
Aragonite	3.5	Manganese	5.0
Arsenic	3.5	Marble	3–4
Asbestos	5	Meerschaum	2–3
Asphalt	1–2	Mica	2.8
Augite	6	Opal	4–6
Barite	3.3	Orthoclase	6
Bell-metal	4	Osmium	7.0
Beryl	7.8	Palladium	4.8
Bismuth	2.5	Phosphorus	0.5
Boric acid	3	Phosphorbronze	4
Boron	9.5	Platinum	4.3
Brass	3–4	Plat-iridium	6.5
Cadmium	2.0	Potassium	0.5
Calamine	5	Pumice	6
Calcite	3	Pyrite	6.3
Calcium	1.5	Quartz	7
Carbon	10.0	Rock salt (halite)	2
Carborundum	9–10	Ross' metal	2.5–3.0
Cesium	0.2	Rubidium	0.3
Chromium	9.0	Ruthenium	6.5
Copper	2.5–3	Selenium	2.0
Corundum	9	Serpentine	3–4
Diamond	10	Silicon	7.0
Diatomaceous earth	1–1.5	Silver	2.5–7
Dolomite	3.5–4	Silver chloride	1.3
Emery	7–9	Sodium	0.4
Feldspar	6	Steel	5–8.5
Flint	7	Stibnite	2
Fluorite	4	Strontium	1.8
Galena	2.5	Sulfur	1.5–2.5
Gallium	1.5	Talc	1
Garnet	6.5–7	Tellurium	2.3
Glass	4.5–6.5	Tin	1.5–1.8
Gold	2.5–3	Topaz	8
Graphite	0.5–1	Tourmaline	7.3
Gypsum	1.6–2	Wax (0°)	0.2
Hematite	6	Wood's metal	3
Hornblende	5.5	Zinc	2.5

COMPARISON OF HARDNESS VALUES OF VARIOUS MATERIALS ON MOHS AND KNOOP SCALES*

Compiled by Laurence S. Foster

Substance	Formula	Mohs value	Knoop value
Talc	$3MgO{\cdot}4SiO_2{\cdot}H_2O$	1	
Gypsum	$CaSO_4{\cdot}2H_2O$	2	32
Cadmium	Cd	..	37
Silver	Ag	..	60
Zinc	Zn	..	119
Calcite	$CaCO_3$	3	135
Fluorite	CaF_2	4	163
Copper	Cu	..	163
Magnesia	MgO	..	370
Apatite	$CaF_2{\cdot}3Ca_3(PO_4)_2$	5	430
Nickel	Ni	..	557
Glass (soda lime)	.....	..	530
Feldspar (orthoclase)	$K_2O{\cdot}Al_2O_3{\cdot}6SiO_2$	6	560
Quartz	SiO_2	7	820
Chromium	Cr	..	935
Zirconia	ZrO_2	..	1160
Beryllia	BeO	..	1250
Topaz	$(AlF)_2SiO_4$	8	1340
Garnet	$Al_2O_3{\cdot}3FeO{\cdot}3SiO_2$	..	1360
Tungsten carbide alloy	WC, Co	..	1400–1800
Zirconium boride	ZrB_2	..	1550
Titanium nitride	TiN	9	1800
Tungsten carbide	WC	..	1880
Tantalum carbide	TaC	..	2000
Zirconium carbide	ZrC	..	2100
Alumina	Al_2O_3	..	2100
Beryllium carbide	Be_2C	..	2410
Titanium carbide	TiC	..	2470
Silicon carbide	SiC	..	2480
Aluminum boride	AlB	..	2500
Boron carbide	B_4C	..	2750
Diamond	C	10	7000

VISCOSITY

Viscosity.—All fluids possess a definite resistance to change of form and many solids show a gradual yielding to forces tending to change their form. This property, a sort of internal friction, is called viscosity; it is expressed in dyne-seconds per cm^2 or poises. Dimensions,—$[m\ l^{-1}\ t^{-1}]$. If the tangential force per unit area, exerted by a layer of fluid upon one adjacent is one dyne for a space rate of variation of the tangential velocity of unity, the viscosity is one poise.

Kinematic viscosity is the ratio of viscosity to density. The c. g. s. unit of kinematic viscosity is the **stoke.**

Flow of liquids through a tube; where l is the length of the tube, r its radius, p the difference of pressure at the ends, η the coefficient of viscosity, the volume escaping per second,

$$v = \frac{\pi p r^4}{8 l \eta} \text{ (Poiseuille).}$$

The volume will be given in cm^3 per second if l and r are in cm, p in dynes per cm^2 and η in poises or dyne-seconds per cm^2.

VISCOSITY OF WATER BELOW 0°C

White-Twining 1914

Temperature	Viscosity centipoises	Temperature	Viscosity centipoises
0°C	1 798	−7.23	2 341
−2 10	1.930	−8 48	2 458
−4 70	2 121	−9 30	2.549
−6.20	2 250		

ABSOLUTE VISCOSITY OF WATER AT 20°C

Swindells, J. R. Coe, Jr., and T. B. Godfrey, Journal of Research, National Bureau of Standards **48,** 1, 1952.

The value found for the viscosity of water at 20°C was 0.010019 ± 0.000003 poise.

The value **0.01002** poise is to be used as the absolute value of the viscosity of water for calibration purposes.

VISCOSITY CONVERSION TABLE

Poise = c.g.s. unit of absolute viscosity = $\frac{\text{gm}}{\text{sec} \times \text{cm}}$

Stoke = c.g.s. unit of kinematic viscosity = $\frac{\text{gm}}{\text{sec} \times \text{cm} \times \text{density}_{(t°F)}}$

Centipoise = 0.01 poise
Centistoke = 0.01 stoke
Centipoises = Centistokes × density (at given temperature)

To convert poises to $\frac{\text{lb}}{\text{sec} \times \text{ft}}$ **or** $\frac{\text{lb}}{\text{hr} \times \text{ft}}$ **multiply by 0.0672 or 242** respectively.

Centistokes	Saybolt Seconds at			Redwood Seconds at			Engler Degrees at all temps.

*100.0	462.0	462.9	465.2	404.9	408.2	416.7	13.16

* At higher values use the same ratio as above for 100 centistokes; e.g., 110 centistokes = 110 × 4.620 Saybolt seconds at 100°F.

To obtain the Saybolt Universal viscosity equivalent to a kinematic viscosity determined at t°F, multiply the equivalent Saybolt Universal viscosity at 100°F by $1 + (t - 100)0.000064$; e.g., 10 centistokes at 210°F are equivalent to 58.8 × 1.0070, or 59.2 Saybolt Universal seconds at 210°F.

24	.9111	50	.5468	76	.3732		
25	.8904	51	.5378	77	.3684		

The above table was calculated from the following empirical relationships derived from measurements in viscometers calibrated with water at 20°C (and one atmosphere), modified to agree with the currently accepted value for the viscosity at 20° of 1.002 cp:

$$0° \text{ to } 20°\text{C}: \log_{10} \eta_T = \frac{1301}{998.333 + 8.1855(\text{T}-20) + 0.00585(\text{T}-20)^2} - 3.30233$$

(R. C. Hardy and R. L. Cottingham, J.Res.NBS *42*, 573 (1949).)

$$20° \text{ to } 100°\text{C}: \log_{10} \frac{\eta_T}{\eta_{20}} = \frac{1.3272(20-\text{T}) - 0.001053(\text{T}-20)^2}{\text{T} + 105}$$

(J. F. Swindells, NBS, unpublished results.)

DIFFUSION COEFFICIENTS IN AQUEOUS SOLUTIONS AT 25°

The diffusion coefficient D may be defined by either of the equations

$$J = -D\frac{\partial c}{\partial x}$$

or

$$\frac{\partial c}{\partial t} = D\frac{\partial^2 c}{\partial x^2}$$

when diffusion occurs in the x-direction only. Here J is the diffusion-flux across unit area normal to the x-direction, $\frac{\partial c}{\partial x}$ is the concentration-gradient at a fixed time, $\frac{\partial c}{\partial t}$ is the rate of change of concentration with time at a fixed distance. If J is expressed in mole cm^{-2} sec^{-1} and c in mole cm^{-3}, x in cm, and t in sec, D will be given in units of cm^2 sec^{-1}. In general D varies somewhat with concentration. The values below are a selection from measurements by modern high-precision methods, mainly by H. S. Harned and collaborators, R. H. Stokes and collaborators, L. J. Gosting and collaborators, and L. G. Longsworth.

For strong electrolytes at infinite dilution, limiting diffusion coefficients may be calculated by the Nernst relation:

$$D = \frac{RT}{F^2}\left[\frac{(\nu_1 + \nu_2)(\lambda_1^0 + \lambda_2^0)}{\nu_1|Z_1|(\lambda_1^0 + \lambda_2^0)}\right]$$

where R = gas constant, F = Faraday, T = absolute temperature, λ_1^0 and λ_2^0 are cation and anion limiting equivalent conductances, ν_1 and ν_2 are the numbers of cations and anions formed from one "molecule" of electrolyte, and Z_1 is the cation valency. Concentrations, unless expressed otherwise are as molarities and the diffusion coefficients are expressed as $10^5 D/cm^2$ sec^{-1} at 25°C.

TRACER DIFFUSION IN METALS
Self Diffusion

John Askill

These tables include data on radio tracer self diffusion in metals reported between 1940 and January 1964.

No distinction has been made between the data as far as reliability is concerned although, in general, the most reliable measurements are the more recent ones using high purity materials, the serial sectioning analysis and giving D_0 values in the range 0.1 to 10. The diffusion coefficient D_T at a temperature T (°K) is given by the relation $D_T = D_0 e^{-Q/RT}$.

The following abbreviations are used:—

A.R.G. = Autoradiography.
R.A. = Residual Activity.
S.D. = Surface Decrease.
S.S. = Serial Sectioning.
P. = Polycrystalline.
S. = Single crystals.
⊥c. = Perpendicular to c direction.
99.95 = 99.95% purity.

DIFFUSION OF METALS INTO METALS

Compiled by Rudolf Loebel

This table is prepared in an alphabetical listing with respect to the symbol for the diffusing metal.

Diffusing metal	Metal diffused into	Temperature °C	D $cm^2/hr.$
Ag	Al	466	$6.84 - 8.1 \times 10^{-7}$
"	"	500	$7.2 - 3.96 \times 10^{-6}$
"	"	573	1.26×10^{-5}
"	Pb	220	5.40×10^{-5}
"	"	250	1.08×10^{-4}
"	"	285	3.29×10^{-4}
"	Sn	500	1.73×10^{-1}
Al	Cu	500	6.12×10^{-9}
"	"	850	7.92×10^{-6}
As	Si		$0.32^{-82,000/RT}$
Au	Ag	456	1.76×10^{-9}
"	"	491	$0.92 - 2.38 \times 10^{-13}$
"	"	585	3.6×10^{-8}
"	"	601	3.96×10^{-8}
"	"	624	$2.5 - 5 \times 10^{-11}$
"	"	717	$1.04 - 2.25 \times 10^{-9}$
"	"	729	1.76×10^{-9}
"	"	767	1.15×10^{-6}
"	"	847	2.30×10^{-6}
"	"	858	3.63×10^{-8}
"	"	861	3.92×10^{-8}
"	"	874	3.92×10^{-8}

PHYSICAL CONSTANTS OF OZONE AND OXYGEN

Armour Research Foundation, 1958

Physical Constant	Ozone (O_3)	Oxygen (O_2)
Molecular Weight	48.0 gg/mol	32.0 g/g mol
Boiling Point (760 mm)	−111.9 ± 0.3°C	−182.96°C
Melting Point	−192.7 ± 0.2°C	−218.4°C
Critical Temperature	−12.1 ± 0.1°C	−118.8°C
Critical Pressure	54.6 atm	49.7 atm
Critical Density	0.437 g/cc	0.430 g/cc
Critical Volume	147.1 cc/mol	74.5 cc/mol
Gas Density (0°C) (760 mm pressure)	2.144 g/liter	1.429 g/liter
Liquid Density		
−112°C	1.358 g/cc	
−183°C	1.571 g/cc	1.14 g/cc
−195.4°C	1.614 g/cc	1.201 g/cc
Surface Tension		
−195°C	43.8 ± 0.1 dyne/cm	
−182.7°C	38.1 ± 0.2 dyne/cm	
−183.0°C	38.4 ± 0.7 dyne/cm	13.2 dyne/cm
Heat Capacity of Liquid		
−183 to −145°C	0.45 cal/g°C	
Heat Capacity of Gas		
−173°C	7.95 cal/g mol°C	
0°C	9.10 cal/g mol°C

PHYSICAL CONSTANTS OF CLEAR FUSED QUARTZ

Based on information contained in Fused Quartz Catalogue Q-7A General Electric Company.

Property	Clear fused quartz	Property	Clear fused quartz
Density	2.2 g./c.c.	Annealing Point	(approx.) 1140°C
Hardness	4.9 (Mohs')	Strain Point	1070°C
Tensile Strength	7,000 p.s.i.	Electrical Resistance	9.5 $\log_{10}$ R for cm.³ at 350°C
Compressive Strength	>160,000 p.s.i.	Dielectric Constant	3.75 at 20°C. 1 Mc.
Bulk Modulus	(approx.) 5.3 × 10^6 p.s.i.	Dielectric Loss Factor	less than .0004 at 20°C. 1 Mc.
Rigidity Modulus	4.5 × 10^6 p.s.i.	Dissipation Factor	less than .0001 at 20°C. 1 Mc.
Young's Modulus	10.4 × 10^6 p.s.i.	Index of Refraction	1.4585
Poisson's Ratio	.16	Velocity of Sound—Shear Wave	3.75 × 10^5 cm./sec.
Coefficient of Thermal Expansion	(av.) 5.5 × 10^{-7} cm./cm./°C {20°C, 320°C}	Velocity of Sound—Compressional Wave	5.90 × 10^5 cm./sec.
Thermal Conductivity	.0033 g. cal./cm.²/sec./°C/cm.	Sonic Attenuation	less than .033 db/ft./mc.
Specific Heat	.18 g. cal./gm.		
Softening Point	(approx.) 1665°C

NOTES: (a) From plotted data.

(b) Epstein equation: $d_t = 0.9514 - 2.392 \times 10^{-4}\, t°C$.

(c) Thomson and Garelis: $d_t = 0.9490 - 22.3 \times 10^{-5} t°C - 1.75 \times 10^{-8} t^2 °C$.

(d) Formula to calculate density: $V = M_K \cdot V_K + M_{Na} \cdot V_{Na}$ (where V, V_K and V_{Na} are the specific volumes (reciprocal of density) of the alloy, K and Na respectively, M_K and M_{Na} the mole fraction of the elements).

(e) Extrapolated by calculation, Epstein equation:

$$K = \frac{2.433 \times 10^{-2}(t + 273.16)}{6.8393 + 3.3873 \times 10^{-2} t + 1.7235 \times 10^{-5} t^2}$$

(f) Epstein equation: $r_t = 10.892 + 0.015272t + 3.6746 \times 10^{-5} t^2 - \frac{379.26}{t}$.

(g) Formula to calculate heat capacity: $C = W_{Na} \cdot C_{Na} + W_K \cdot C_K$ (where C, C_{Na} and C_K are the heat capacity of the alloy, Na and K respectively, W_{Na} and W_{Ka} the weight fractions of Na and K respectively in the alloy).

(h) 150°C.

MECHANICAL AND PHYSICAL PROPERTIES OF WHISKERS

From NASA SP-5055

This table lists some nominal values for physical and mechanical properties of some whiskers. The strength of whiskers is influenced by temperature, time, surface conditions, surface films or corrosion, crystallographic orientation, impurities and testing techniques.

Material	Tensile Strength (σ_f) lb/in.$^2 \times 10^{-6}$	Young's Modulus (E) lb/in.$^2 \times 10^{-6}$	Specific Gravity (S) lb/in.$^2 \times 10^{-6}$	$\frac{(\sigma_f)}{(S)}$ inch	$\frac{(E)}{(S)}$ inch

OPAQUE WHITE PIGMENTS

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Titanium calcium white, TiO_2 (25%) + $CaSO_4$ (75%)	3.10	prism. or ragged gr.	mostly 1.8–2.0 (irr.) (bi.) [M*]
Titanium dioxide (rutile) + $CaSO_4$	3.25	...	Av. 1.98 [TPC]
Titanium barium white, TiO_2 (25%) + $BaSO_4$ (75%)	4.30	min. round. gr.	$n_{\Sigma}c$ 1.7–2.5 [M*]
White lead (basic sulfate) $PbSO_4 \cdot PbO$	6.46	...	Av. 1.93 [TPC]
Lithopone	4.3	...	Av. 1.84 [TPC]
Lithopone (regular), ZnS (28–30%), $BaSO_4$ (72–70%)	4.30	fine comp. gr.	2.3 (ZnS)–1.64 ($BaSO_4$) [M]
Zinc white (ordinary), ZnO	5.65	v. fine cryst. gr.	ϵ2.02, ω2.00 [M]
(acicular), ZnO	...	spicules, fourlets	ϵ2.02, ω2.00 [M*]
White lead (basic carbonate), $2PbCO_3 \cdot Pb(OH)_2$	6.70	v. fine cryst.	ϵ1.94, ω2.09 [M]
Antimony oxide, Sb_2O_3	5.75	v. fine cryst.	valentinite, α2.18, γ and β2.35 [LB, M*] senarmonite, 2.09 (isot.)
Zirconium oxide (baddeleyite), ZrO_2	5.69	...	χ2.13, γ2.20, β2.19 [LB], Av. 2.40 [TPC]
Titanium dioxide (anatase), TiO_2	3.9	min. round. gr.	ϵ and ω 2.5 (w. bi.) [M*]
(rutile), TiO_2	4.2	round. or prism. gr.	ϵ2.9, ω2.6 [M*]

TRANSPARENT WHITE PIGMENTS†

Diatomaceous earth, SiO_2	2.31	min. fossil forms	n mostly 1.435, some 1.40 [M*]
Aluminum stearate, $Al(C_{18}H_{35}O_2)_3$	0.99	agg. of spher. gr.	1.49 (w. bi.) [W]
Pumice (volcanic glass), Na, K, Al, silicate	...	vesicular vitr. frag.	c 1.50 (isot.) [M*]
Aluminum hydrate, $Al(OH)_3$	2.45	v. fine amorph. part.	$n_{\Sigma}c$ 1.50–1.56 [M*]
Gypsum, $CaSO_4 \cdot 2H_2O$	2.36	fine cryst. gr.	α1.520, γ1.530, β1.523 [LB]
Silica quartz), SiO_2	2.66	cryst. frag.	ϵ1.553, ω1.544 [LB]
(chalcedony), SiO_2	2.6	crypt. agg.	ϵ, ω1.54 [LB, M*]
China clay (kaolinite), $Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$	2.60	fine, vermicular cryst.	α1.558, γ1.565, β1.564 (all ± .005) [LB, M*]
Talc, $3MgO \cdot 4SiO_2 \cdot H_2O$	2.77	platy frag.	α1.539, γ1.589, β1.589 [LB]
Mica (muscovite), $H_2KAl_3(SiO_4)_3$	2.89	platy frag.	α1.563, γ1.604, β1.599 [LB]
Anhydrite, $CaSO_4$	2.93	cryst. frag.	α1.570, γ1.614, β1.575 [LB]
Chalk (whiting), $CaCO_3$	2.70	hollow spherulites	$\epsilon_{\Sigma}c$ 1.510, $\omega_{\Sigma}c$ 1.645 [M*]
Barytes (barite, nat.), $BaSO_4$	4.45	cryst. frag.	α1.636, γ1.648, β1.637 [LB]
(blanc fixe, art.), $BaSO_4$	4.36	v. fine cryst. agg.	1.62–1.64 [M*]
Barium carbonate, $BaCO_3$ (witherite)	4.3	...	α1.529, γ1.677, β1.676 [LB]

†Also called "Extender" or "Inert" White Pigments.

IRON OXIDE PIGMENTS

Ochre, yellow (goethite), $Fe_2O_3 \cdot H_2O$, clay, etc.	2.9–4.0	irr. spherulites	n_{Σ}2.0 (isot. part); (α, β)$_{\Sigma}$ 2.05–2.31; γ_{Σ} 2.08–2.40 (bi. part) [M*]
Sienna, raw (goethite), $Fe_2O_3 \cdot H_2O$, clay, etc.	3.14	uneven spherulites	1.87–2.17 (mostly 2.06) (isot.) [M*]
Sienna, burnt, Fe_2O_3, clay, etc.	3.56	uneven, round. part.	c1.85 (var.) (isot.) [M]
Umber, raw, $Fe_2O_3 + MnO_2 + H_2O$, clay, etc.	3.20	uneven, round. gr.	mostly 1.87–2.17 [M*]
Umber, burnt, $Fe_2O_3 + MnO_2$, clay, etc.	3.64	uneven, round. gr.	mostly 2.2–2.3 [M*]
Iron oxide red (haematite), Fe_2O_3	5.2	min. cryst.	ϵ_{Li} 2.78, ω_{Li} 3.01 [M]

RED AND ORANGE PIGMENTS

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Red lead, Pb_3O_4 (*c*95%)	8.73	crypt. agg.	2.42_{Li} (w. bi.; pleo.) [M]
**Realgar, As_2S_2	3.56	cryst. frag.	α_{Li} 2.46, γ_{Li} 2.61, β_{Li} 2.59 [LB]
Molybdate orange, $Pb(Mo,S,Cr,P)O_4$	...	min. round. gr.	β_{Li} 2.55 (s. bi.) [M*]
Chrome orange, $PbCrO_4 \cdot Pb(OH)_2$	6.7	tabular cryst.	α2.42, γ2.7 + , β2.7 [M*]
Cadmium red lithopone, $CdS(Se) + BaSO_4$	4.30	min. round. gr.	2.50–2.76 (for CdS(Se)part) (isot.) [M*]
Cadmium red, CdS(Se)	4.5	min. round. gr.	2.64 (bright red)–2.77 (deep red) (isot.) [M*]
Antimony vermilion, Sb_2S_3	...	v. fine red glob.	n_{Li} 2.65 (isot.) [M*]
Vermilion (art.), HgS	8.09	hexagonal gr. and prisms	ϵ_{Li} 3.14, ω_{Li} 2.81 [M]
**(nat., cinnabar), HgS	8.1	cryst. frag.	ϵ_{Li} 3.146, ω_{Li} 2.819 [LB]
Quinacridone red, $C_{20}H_{12}O_2N_2$ (gamma)	1.5	thin plates	n_{Na} Av. 2.04 [Du P]

YELLOW PIGMENTS

**Gamboge, organic resin	...	irr. amorph. part.	1.582–1.586 [W]
**Indian yellow, $C_{19}H_{15}O_{11}Mg \cdot 5H_2O$	...	prisms, plates	1.67 (w. bi.) [M*]
Cobalt yellow, $CoK_3(NO_2)_6 \cdot H_2O$	...	fine dendritic cryst.	1.72–1.76 (isot.) [W]
Zinc yellow, $4ZnO \cdot 4CrO_3 \cdot K_2O \cdot 3H_2O$	3.46	min. spher. gr.	1.84–1.9 (irr.; bi.) [M*]
Strontium yellow, $SrCrO_4$	...	small needles	α, β (or ω) 1.92, γ (or ϵ) 2.01 (||ext.) [M*]
Barium yellow, $BaCrO_4$	4.49	v. fine cryst. gr.	1.94–1.98 (bi.) [M]
**Naples yellow, $Pb_3(SbO_4)_2$	...	round. gr.	2.01–2.28 (isot.) [M*]
Chrome yellow (med.), $PbCrO_4$	5.96	fine prism. gr.	$\alpha_{620m\mu} < 2.31$, $\gamma_{550m\mu}$ 2.49 [M]
Cadmium yellow lithopone, $CdS + BaSO_4$	4.25	fine comp. gr.	2.39–2.40 (for CdS part) [M*]
Cadmium yellow, CdS	4.35	min. round. gr.	2.35–2.48 (isot.) [M*]
Massicot (litharge), PbO	9.40	min. flakes	α_{Li} 2.51, γ_{Li} 2.71, β_{Li} 2.61 [M]
**Orpiment, As_2S_3	3.4	min. flakes	α_{Li} 2.4 ± , γ_{Li} 3.02, β_{Li} 2.81 [LB]

GREEN PIGMENTS

Phthalocyanine green, chloro-copper phthalocyanine	2.1	laths	$n_{580m\mu}$ 1.40 [ACC]
**Verdigris (copper basic acetate), $Cu(C_2H_3O_2)_2 \cdot 2Cu(OH)_2$	...	cryst. frag.	α1.53, γ1.56 [M]
**Chrysocolla, $CuSiO_3 \cdot \eta H_2O$	2.4	crypt. agg.	α1.575, γ1.598, β1.597 [LB]
Green earth (celadonite and glauconite), Fe, Mg, Al, K, hydrosilicate	2.5 2.7	round. irr. gr.	n var. *c* 1.62, (porous) [M*]
Emerald green (Paris green), $Cu(C_2H_3O_2)_2 \cdot 3Cu(AsO_2)_2$	3.27	spherulites and disks	α_Σ1.71, γ_Σ1.78 (w. pleo.) [M*]
**Malachite, $CuCO_3 \cdot Cu(OH)_2$	4.0	cryst. frag.	α1.655, γ1.909, β1.875 [LB]
Cobalt green, $CoO \cdot \eta ZnO$	...	spher. gr.	1.94–2.0 (w. bi.) [M*]
Viridian (chromium oxide, transparent), $Cr_2O_3 \cdot 2H_2O$	3.32	spherul. gr.	α, β_Σ 1.82, γ_Σ 2.12 [M*]
Chrome green (med.), $Fe_4[Fe(CN)_6]_3 + PbCrO_4$	4.06	fine green agg.	*c* 2.4 (cf. Prussian blue and chrome yellow)
Chromium oxide green, opaque, Cr_2O_3	5.10	fine cryst. agg.	n_{Li} 2.5 [M]

BLUE PIGMENTS

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Phthalocyanine blue, copper phthalocyanine	1.6	laths	Av. 1.38 [DuP]
Ultramarine blue (art.), $Na_{8-10}Al_6Si_6O_{24}S_{2-4}$	2.34	uniform small round. gr.	n 1.51 $_{green}$, 1.63 $_{red}$ (isot.) [M]
**(nat., lazurite), $3Na_2O \cdot 3Al_2O_3 \cdot 6SiO_2 \cdot 2Na_2S$	2.4	angular, broken frag.	1.50± (isot.) [LB]
**Maya blue, Fe, Mg, Ca, Al, silicate (?)	...	porous irr. agg.	$\beta\Sigma$1.54 (irr.; bi. and pleo.) [M*]
Smalt, K, Co(Al), silicate (glass)	...	splintery, vitr. frag.	1.49–1.52 [M*]
Prussian blue, $Fe_4[Fe(CN)_6]_3$	1.83	colloidal agg.	$1.56_{450m\mu}$ [M*]
**Egyptian blue, $CaO \cdot CuO \cdot 4SiO_2$	...	cryst. frag.	ϵ1.605, ω1.635 [APL]
Manganese blue, $BaMnO_4 + BaSO_4$	...	gr. and stubby prisms	c 1.65 [W]
**Blue verditer, $2CuCO_3 \cdot Cu(OH)_2$	...	fibrous agg.	$\alpha\Sigma$1.72, $\gamma\Sigma$slightly > 1.74 [M*]
Cobalt blue, $CoO \cdot Al_2O_3$	3.83	round. gr.	n var.; max. c 1.74_{blue} (isot.) [M]
**Azurite, $2CuCO_3 \cdot Cu(OH)_2$	3.80	cryst. frag.	α1.730, γ1.838, β1.758 [LB]
Cerulean blue, $CoO \cdot \eta SnO_2$	...	round gr.	1.84 (isot.) [M*]

VIOLET PIGMENTS

Ultramarine violet	...	round. gr. (blue, rose and violet)	c 1.56 (isot.) [M*]
Cobalt violet, $Co_3(PO_4)_2$	...	round. gr.	ϵ1.65–1.79 (dull violet), ω1.68–1.81 (salmon) (s. bi.) [M*]
Manganese violet, $(NH_4)_2Mn_2(P_2O_7)_2$	...	fine cryst. gr.	α1.67, γ1.75, β1.72 (for violet) [M]
Quinacridone violet, $C_{20}H_{12}O_2N_2$ (beta)	1.5	thin plates	Av. 2.02 [DuP]

BROWN PIGMENTS

Sepia (organic)	...	angular frag.	(opaque) [M*]
Asphaltum (bitumen)	...	irr. amorph. part.	1.64–1.66 [M*]
Van Dyke brown (bituminous earth)	1.66	irr. amorph. part.	1.62–1.69 [M*]

BLACK PIGMENTS

Bone black, C + $Ca_3(PO_4)_2$	2.29	irr. coarse grains	1.65–1.70 (for larger translucent gr.) [M]
Lamp black, C	1.77	min. round. part.	(opaque)
Charcoal black, C	...	irr. splintery part.	(opaque)
Graphite, C	2.36	irr. plates	(opaque) [M]

[1]Abbreviations: art. = artificial; med. = medium; nat. = natural. The chemical formulas are those commonly accepted in chemical and mineralogical literature, but they may not compare exactly with structural formulas based on x-ray diffraction data or even on critical chemical analysis.

[2]The figures for specific gravity of the artificial pigments are mainly from H. A. Gardner, pp. 710–712, and those on the mineral pigments are chiefly from E. S. Larsen and H. Berman.

[3]Symmetry terms (monoclinic, orthorhombic, etc.) are omitted because pigments are so finely divided that it is rare when observations on crystal symmetry can be made. The term "spherulitic," as used here means aggregates that tend toward radial structure and spherical shape. "Amorphous" describes materials that are microscopically formless but may be truly crystalline on the basis of x-ray diffraction data. Abbreviations: agg. = aggregate(s); amorph. = amorphous; comp. = composite; crypt. = cryptocrystalline; cryst. = crystal(s); frag. = fragment(s); glob. = globule(s); gr. = grain(s); irr. = irregular; min. = minute; part. = particle(s); prism. = prismatic; round. = rounded; spher. = spheroidal; spherul. = spherulitic; var. = variable; v. = very; vitr. = vitreous.

[4]Unless otherwise indicated, all refractive index measurements are by sodium light. Σ is the symbol used by H. E. Merwin to indicate greater or less indefiniteness or irregularity in the case of aggregates, especially in respect to refractive index. Abbreviations: bi. = birefringent; c = *circa*; ext. = extinction; isot. = isotropic; || = parallel; pleo. = pleochroic; s. = strongly; w. = weakly. The letters in brackets refer to the authorities for the refractive index data: M = H. E. Merwin; M* = H. E. Merwin, data by private communication, hitherto unpublished; W = C. D. West data by private communication, hitherto unpublished; LB = E. S. Larsen and H. Berman; APL = A. P. Laurie and co-authors; ACC = A. C. Cooper, "The refractive index of organic pigments. Its determination and significance," *Journal Oil & Colour Chemists Association*, Vol. 31 (1948), pp. 343–357; TPC = Titanium Pigment Corporation; Du P = E. I. Du Pont de Nemours & Co.

**Chiefly of historical interest.

CRITICAL TEMPERATURES AND PRESSURES

Compiled by Rudolfh Loebel

711	32.7	800	183				

The chemical terms have been compiled with the collaboration of
B. Clifford Hendricks

AB-.—A prefix attached to the names of the practical electric units to indicate the corresponding unit in the cgs electromagnetic system (emu), e.g. abampere, abvolt.

Abcoulomb.—The abcoulomb, the emu of charge, is defined as the charge which passes a given surface in one second if a steady current of one abampere flows across the surface. Its dimensions are, therefore, $cm^{\frac{1}{2}} gm^{\frac{1}{2}}$, which differ from the dimensions of the statcoulomb by a factor which has the dimensions of a speed. This relationship is connected with the fact that the ratio $2K_e/K_m$ must have the value of the square of the speed of light in any consistent system of units. It follows further that

$$1 \text{ abcoulomb} = 2.99793 \times 10^{10} \text{ statcoulomb},$$

the speed of light in vacuo being $(2.99793 \pm 0.000003) \times 10^{10}$ cm/sec.

Abegg's rule.—For use in regard to a helical periodic system. If the maximum positive valence exhibited by an element be numerically added to its maximum negative valence, there is evidently a tendency for the sum to equal 8. This tendency is exhibited especially by the elements of the 4th, 5th, 6th and 7th groups and is known as Abegg's rule.

Absolute humidity.—See *Humidity*

Absolute pressure.—See *Pressure*

Absolute temperature.—Temperature reckoned from the absolute zero. See *Temperature*

Absolute units.—A system of units based on the smallest possible number of independent units. Specifically, units of force, work, energy and power not derived from or dependent on gravitation.

Absolute zero.—The temperature at which a gas would show no pressure if the general law for gases would hold for all temperatures. It is equal to $-273.15°C$ or $-459.67°F$.

Absorption.—1. Penetration of a substance into the body of another. 2. Transformation into other forms suffered by radiant energy passing through a material substance.

Absorption coefficient.—See *Absorption factor*

Absorption factor.—The ratio of the intensity loss by absorption to the total original intensity of radiation. If I_o represents the original intensity, I_r, the intensity of reflected radiation, I_t, the intensity of the transmitted radiation, the absorption factor is given by the expression

$$\frac{I_o - (I_r + I_t)}{I_o}$$

Also called coefficient of absorption.

Permission was granted by D. Van Nostrand Company, Inc. publishers of The Dictionary of Physics and Electronics for the inclusion of 18 definitions in this section.

Absorption, Lambert's law.—If I_o is the original intensity, I the intensity after passing through a thickness x of a material whose absorption coefficient is k,

$$I = I_o e^{-kx}$$

The **index of absorption** k' is given by the relation $k = (4\pi k'n)/\lambda$ where n is the index of refraction and λ the wave length in vacuo. The **mass absorption** is given by k/d when d is the density. The transmission factor is given by I/I_o.

Absorption spectrum.—The spectrum obtained by the examination of light from a source, itself giving a continuous spectrum, after this light has passed through an absorbing medium in the gaseous state. The absorption spectrum will consist of dark lines or bands, being the reverse of the emission spectrum of the absorbing substance.

When the absorbing medium is in the solid or liquid state the spectrum of the transmitted light shows broad dark regions which are not resolvable into lines and have no sharp or distinct edges.

Absorptive power or absorptivity for any body is measured by the fraction of the radiant energy falling upon the body which is absorbed or transformed into heat. This ratio varies with the character of the surface and the wave length of the incident energy. It is the ratio of the radiation absorbed by any substance to that absorbed under the same conditions by a black body.

Abvolt.—The cgs electromagnetic unit of potential difference and electromotive force. It is the potential difference that must exist between two points in order that one erg of work be done when one abcoulomb of charge is moved from one point to the other. One abvolt is 10^{-8} volt.

Acceleration.—The time rate of change of velocity in either speed or direction. Cgs unit,—one centimeter per second per second. Dimensions,—$[l\ t^{-2}]$.—See *Angular acceleration*

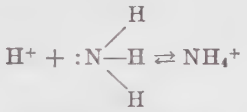
Acceleration due to gravity.—The acceleration of a body freely falling in a vacuum. The International Committee on Weights and Measures has adopted as a standard or accepted value, 980.665 cm/sec² or 32.174 ft/sec².

Acceleration due to gravity at any latitude and elevation.—If ϕ is the latitude and H the elevation in centimeters the acceleration in cgs units is, $g = 980.616 - 2.5928 \cos 2\phi + 0.0069 \cos^2 2\phi - 3.086 \times 10^{-6} H$. (Helmert's equation)

Accelerators.—Machines for speeding up subatomic particles to energies running into millions of electron volts.—See *Betatron, cyclotron,* etc.

Achromatic.—A term applied to lenses signifying their more or less complete correction for chromatic aberration.

Acid.—For many purposes it is sufficient to say that an acid is a hydrogen-containing substance which dissociates on solu-



DEFINITIONS AND FORMULAS
The chemical terms have been compiled with the collaboration of
B. Clifford Hendricks

tion in water to produce one or more hydrogen ions. More generally, however, acids are defined according to other concepts. The Brönsted concept states that an acid is any compound which can furnish a proton. Thus NH_4^+ is an acid since it can give up a proton:

$$NH_4^+ \rightleftarrows NH_3 + H^+$$

and NH_3 is a base since it accepts a proton.

A still more general concept is that of G. N. Lewis which defines an acid as anything which can attach itself to something with an unshared pair of electrons. Thus in the reaction

the NH_3 is a base because it possesses an unshared pair of electrons. This latter concept explains many phenomena, such as the effect of certain substances other than hydrogen ions in the changing of the color of indicators. It also explains acids and bases in non-aqueous sytems as liquid NH_3 and SO_2.

Actinide Series.—Elements of atomic numbers 89 to 103 analogous to the lanthanide series of the so-called rare earths.

Action is measured by the product of work by time. Cgs units of action are the erg-second and the joule-second. Dimensions,—$[m\ l^2\ t^{-1}]$. Planck's quantum or constant of action is $(6.62517 - 0.00023) \times 10^{-27}$ erg-sec.

Active mass of a substance is the number of gram molecular weights per liter in solution, or in gaseous form.

Activity coefficient.—A factor which, when multiplied by the molecular concentration yields the active mass. The activity coefficient is evaluated by thermodynamic calculations, usually from data on the emf of certain cells, or the lowering of the freezing point of certain solutions. It is a correction factor which makes the thermodynamic calculations correct.

Adiabatic.—A body is said to undergo an adiabatic change when its condition is altered without gain or loss of heat. The line on the pressure volume diagram representing the above change is called an adiabatic line.

Adsorption.—The condensation of gases, liquids, or dissolved substances on the surfaces of solids is called adsorption.

Air columns, frequency of vibration in—See *Organ pipes*

Allobar.—A form of an element differing in isotopic composition from the naturally occurring form.

Allotropy.—The property shown by certain elements or being capable of existence in more than one form, due to differences in the arrangement of atoms or molecules.—See *Monotropic* and *Enantiotropic*

Alpha (α)-particle, or alpha-ray.—One of the particles emitted in radioactive decay. It is identical with the nucleus of the helium atom and consists, therefore, of two protons plus two neutrons bound together. A moving alpha particle is strongly ionizing and so loses energy rapidly in traversing through matter. Natural alpha particles will traverse only a few centimeters of air before coming to rest.

Alternating current, (A-C).—Current in which the charge-flow periodically reverses, as opposed to direct current, and whose average value is zero. Alternating current usually implies a sinusoidal variation of current and voltage. This behavior is represented mathematically in various ways:

$$\begin{aligned} \mathrm{I} &= I_0 \cos\ (2\pi f t + \phi) \\ \mathrm{I} &= I_0\ \angle\phi \\ \mathrm{I} &= I_1 e^{j\omega t} \end{aligned}$$

where f is the frequency; $\omega \equiv 2\pi f$, the pulsatance, or radian frequency; ϕ the phase angle; I_0 the amplitude; and I_1 the complex amplitude. In the complex rotation, it is understood that the actual current is the real part of I. For circuits involving also a capacitance C in farads and L in henrys, the impedance becomes,

$$\sqrt{R^2 + \left(2\pi f L - \frac{1}{2\pi f C}\right)^2}$$

Altitudes with the barometer.—If b_1 and b_2 denote the corrected barometer readings at two stations, t the mean of the temperatures, t_1 and t_2 of the air at the two stations, e_1 and e_2 the tension of water vapor at the two stations, h the mean height above sea level, ϕ the latitude; then the difference in elevation in centimeters is $H = 1{,}843{,}000\ (\log b_1 - \log b_2)\ (1 + 0.00367t)\ (1 + 0.0026 \cos 2\phi + 0.00002h + \frac{3}{8}k)$, where

$$k = \tfrac{1}{2}\left(\frac{e_1}{b_1} + \frac{e_2}{b_2}\right)$$

An approximate formula, sufficient for differences not over 1000 meters is

$$H = 1{,}600{,}000\ \frac{b_1 - b_2}{b_1 + b_2}\ (1 + 0.004t).$$

Amorphous.—Without definite form, not crystallized.

Ampere's rule.—A positive charge moving horizontally is deflected by a force to the right if it is moving in a region where the magnetic field is vertically upward. This may be generalized to currents in wires by recalling that a current in a certain direction is equivalent to the motion of positive charges in that direction. The force felt by a negative charge is opposite to that felt by a positive charge.

Amplitude.—The maximum value of the displacement in an oscillatory motion.

AMU.—The atomic mass unit, a unit of mass equal to one-sixteenth the mass of the atom of oxygen of mass number 16.

1 amu = $(1.65979 \pm 0.00004) \times 10^{-24}$ grams (Physical)
9.31141×10^{8} e.v. "
$(1.66024 \pm 0.00004) \times 10^{-24}$ (Chemical)
9.31395×10^{8} e.v. "

In terms of energy, 1 amu = 931 mev = 1.49×10^{-3} ergs.

Angle.—The ratio between the arc and the radius of the arc. Units of angle,—the radian, the angle subtended by an arc equal to the radius; the degree, $\frac{1}{360}$ part of the total angle about a point. Dimensions,- a numeric.

Angstrom.—A unit of length, used especially in expressing the length of light waves, equal to one ten-thousandth of a micron, or one hundred-millionth of a centimeter (1×10^{-8} cm).

Angular acceleration.—The time rate of change of angular velocity either in angular speed or in direction of the axis of rotation (precession). Cgs unit,—one radian per second per second. Dimensions,—$[t^{-2}]$.

If the initial angular velocity is ω_o, and the velocity after time t is ω_t, the angular acceleration,

$$\alpha = \frac{\omega_t - \omega_o}{t}$$

The angular velocity after time t,

$$\omega_t = \omega_o + \alpha t$$

The angle swept out in time t,

$$\theta = \omega_o t + \tfrac{1}{2}\alpha t^2$$

The angular velocity after movement through the arc θ,

$$\omega = \sqrt{\omega_o^2 + 2\alpha\theta}$$

In the above equations, for angular displacement in radians, angular velocity will be in radians per second and angular acceleration in radians per second per second.

Angular aperture of an objective is the largest angular extent of wave surface which it can transmit.

Angular harmonic motion or harmonic motion of rotation.—Periodic, oscillatory angular motion in which the restoring torque is proportional to the angular displacement. Torsional vibration.

Angular momentum or moment of momentum.—Quantity of angular motion measured by the product of the angular velocity and the moment of inertia. Cgs unit,—unnamed, its nature is expressed by g-cm²/sec. Dimensions, —$[m\ l^2\ t^{-1}]$.

The angular momentum of a mass whose moment of inertia is I, rotating with angular velocity ω, is $I\omega$.

Angular velocity.—Time rate of angular motion about an axis. Cgs unit,—one radian per second. Dimensions,—$[t^{-1}]$.

If the angle described in time t is θ, the angular velocity,

$$\omega = \frac{\theta}{t}$$

θ in radians and t in seconds gives ω in radians per second.

Anhydride (of acid or base).—An oxide which when combined with water gives an acid or base.

Anion.—A negatively charged ion.

Anode.—The electrode at which oxidation occurs in a cell. It is also the electrode toward which anions travel due to the electrical potential. In spontaneous cells the anode is considered negative. In non-spontaneous or electrolytic cells the anode is considered positive.

Apochromat.—A term applied to photographic and microscope objectives indicating the highest degree of color correction.

Archimedes principle.—A body wholly or partly immersed in a fluid is buoyed up by a force equal to the weight of the fluid displaced. A body of volume V cm³ immersed in a fluid of density ρ grams per cm³ is buoyed up by a force in dynes,

$$F = \rho g V$$

where g is the accleration due to gravity.

A floating body displaces its own weight of liquid.

Area, unit of.—The square centimeter. The area of a square whose sides are one centimeter in length. Other units of area are similarly derived. Dimensions,—$[l^2]$.

Arrhenius theory of electrolytic dissociation states that the molecule of an electrolyte can give rise to two or more electrically charged atoms or ions.

Astigmatism is an error of spherical lenses peculiar to the formation of images by oblique pencils. The image of a point when astigmatism is present will consist of two focal lines at right angles to each other and separated by a measurable distance along the axis of the pencil. The error is not eliminated by reduction of aperture as is spherical aberration.

Atom.—The smallest particle of an element which can enter into a chemical *combination*. All chemical compounds are formed of atoms, the difference between compounds being attributable to the nature, number, and arrangement of their constituent atoms.—See *isotopes, nuclear atom*

Atomic bomb.—An explosive that derives its energy from the fission or fusion of atomic nuclei.

Atomic energy.—1. The constitutive internal energy of the atom which was absorbed when it was formed. 2. Energy derived from the mass converted into energy in nuclear transformations.—See *Einstein's formula*

Atomic mass (atomic weight).—The mass of a neutral atom of a nuclide. It is usually expressed in terms of the physical scale of atomic masses, that is, in atomic mass units (amu). See AMU

Atomic number.—The number (Z) of protons within the atomic nucleus. The electrical charge of these protons determines the number and arrangement of the outer electrons of the

atom, and thereby the chemical and physical properties of the element.

Atomic structure.—According to the currently accepted view, the atom consists of a central part, called nucleus, and a number of *electrons* (called orbital or planetary electrons) circling about the latter, like planets about the sun. The nucleus is of a high specific weight; it contains most of the mass of the entire atom (its mass is considered equal to the atomic mass) and is composed of positively charged particles, called *protons* (the number of which always equals the atomic number, (Z), and particles of 0 charge, called neutrons (the number of which equals the difference between the atomic weight and the atomic number, $A - Z$). The diameter of the nucleus is between 10^{-13} and 10^{-12} cm, and the relatively vast distance in which the orbital electrons circle about it is illustrated by the fact that this nuclear diameter is only 10^{-4} to 10^{-5} of the entire atomic diameter. While the nucleus carries an integral number of positive charges (an integral number of protons) each of $1{\cdot}6 \times 10^{-19}$ coulomb, each electron carries one negative charge of $1{\cdot}6 \times 10^{-19}$ coulomb, and the number of orbital electrons is equal to the number of protons in the nucleus (i.e. to the atomic number, Z), so that the atom as a whole has a net charge of 0. The electrons are arranged in successive shells (q.v.) around the nucleus; the maximum number of electrons in each shell is determined by natural laws, and the extranuclear electronic structure of the atom is characteristic of the element. The electrons in the inner shells are tightly bound to the nucleus; this inner structure can be altered by high-energy particles, γ-rays of radium, or x-rays. The electrons in the outer shells are responsible for the chemical properties of the element.—See *Bohr's atomic theory, Heisenberg's theory, shell and subshell*

Atomic theory.—All elementary forms of matter are composed of very small unit quantities called atoms. The atoms of a given element all have the same size and weight. The atoms of different elements have different sizes and weights. Atoms of the same or different elements unite with each other to form very small unit quantities of compound substances called molecules.

Atomic weight.—Atomic weight is the relative weight of the atom on the basis of oxygen as 16. For a pure isotope, the atomic weight rounded off to the nearest integer gives the total number of nucleons (neutrons and protons) making up the atomic nucleus. If these weights are expressed in grams they are called gram atomic weights.—See *Isotopes and Atomic Mass*

Avogadro's law.—Equal volumes of different gases at the same pressure and temperature contain the same number of molecules.

Avogadro's number.—The number of molecules in one mole or gram-molecular weight of a substance. A number of values of the Avogadro number, which is usually denoted by N, have been found by various methods, generally lying within a range of 1% about the value 6.02252×10^{23} per gram mole.

Avogadro's principle (or theory).—The numbers of molecules present in equal volumes of gases at the same temperature and pressure are equal.

Babo's law.—The addition of a non-volatile solid to a liquid in which it is soluble lowers the vapor pressure of the solvent in proportion to the amount of substance dissolved.

Balmer series of spectral lines. The wave lengths of a series of lines in the spectrum of hydrogen are given in angstroms by the equation

$$\lambda = 3646 \frac{N^2}{N^2 - 4}$$

where N is an integer having values greater than 2.

Bar.—International unit of pressure 10^6 dyne/cm². Unfortunately some writers have used this term for 1 dyne/cm². 1 bar = 0.987 atmosphere.

Barn.—Unit for measuring capture cross sections (q.v.) of elements. One barn = 10^{-24} cm² per nucleus.

Barye.—Cgs pressure unit = one dyne/cm².

Bases.—For many purposes it is sufficient to say that a base is a substance which dissociates on solution in water to produce one or more hydroxyl ions. More generally, however, bases are defined according to other concepts. The Brönsted concept states that a base is any compound which can accept a proton. Thus NH_3 is a base since it can accept a proton to form ammonium ions.

$$NH_3 + H^+ \rightleftarrows NH_4^+$$

A still more general concept is that of G. N. Lewis which defines a base as anything which has an unshared pair of electrons. Thus in the reaction

$$H^+ + :N(H)(H)(H) \rightleftarrows NH_4^+$$

the NH_3 is a base because it possesses an unshared pair of electrons. This latter concept explains many phenomena, such as the effect of certain substances other than hydrogen ions in the changing of the color of indicators. It also explains acids and bases in non-aqueous systems as liquid NH_3 and SO_2.

Beat(s).—Two vibrations of slightly different frequencies f_1 and f_2 when added together, produce in a detector sensitive to both these frequencies, a regularly varying response which rises and falls at the "beat" frequency $f_b = |f_1 - f_2|$. It is important to note that a resonator which is sharply tuned to f_b alone will not resound at all in the presence of these two beating frequencies.—See *Combination Frequencies*

Beat frequencies.—The beat of two different frequencies of signals on a non-linear circuit when they combine or beat together. It has a frequency equal to the difference of the two applied frequencies.

Beer's law.—If two solutions of the same colored compound be made in the same solvent, one of which is, say, twice the concentration of the other, the absorption due to a given thickness of the first solution should be equal to that of twice the thickness of the second.

Mathematically this may be expressed $l_1c_1 = l_2c_2$ when the intensity of light passing through the two solutions is a constant and if the intensity and wave length of light incident upon each solution are the same.

Bernoulli's theorem.—At any point in a tube through which a liquid is flowing the sum of the pressure energy, potential energy, and kinetic energy is constant. If p is pressure; h, height above a reference plane; d, density of the liquid, and v, velocity of flow,

$$p + hdg + \tfrac{1}{2}\, dv^2 = \text{a constant.}$$

Berthelot principle of maximum work.—Of all possible chemical processes which can proceed without the aid of external energy, that process always takes place which is accompanied by the greatest evolution of heat. This law holds good for low temperatures only and does not account for endothermic reactions.

Beta (β)-particle, (Beta ray).—One of the particles which can be emitted by a radioactive atomic nucleus. It has a mass about $\frac{1}{1837}$ that of the proton. The negatively charged beta particle is identical with the ordinary electron, while the positively charged type (positron) differs from the electron in having equal but opposite electrical properties. The emission of an electron entails the change of a neutron into a proton inside the nucleus. The emission of a positron is similarly associated with the change of a proton into a neutron. Beta particles have no independent existance inside the nucleus, but are created at the instant of emission.—See *Neutrino*

Betatron.—An accelerator used to impart high velocities to electrons (beta particles). Propellant is an electromagnetic field. A five to six Mev betatron can produce X-rays equivalent to the gamma readiation of 10 to 20 grams of radium.

Bevatron.—A six or more billion electron volt accelerator of protons and other atomic particles. Makes use of a Cockcroft-Walton transformer cascade accelerator and a linear (q.v.) as well as an electromagnetic field in the build-up.

Black body.—If, for all values of the wave length of the incident radiant energy, all of the energy is absorbed the body is called a black body.

Bohr's atomic theory.—The theory that atoms can exist for a duration solely in certain states, characterized by definite electronic orbits, i.e., by definite energy levels of their extranuclear electrons, and in these stationary states they do not emit radiation; the jump of an electron from an orbit to another of a smaller radius is accompanied by monochromatic radiation.

Boyle's law for gases.—At a constant temperature the volume of a given quantity of any gas varies inversely as the pressure to which the gas is subjected. For a perfect gas, changing from pressure p and volume v to pressure p' and volume v' without change of temperature,

$$pv = p'v'$$

Breeder, Reactor (Breeder pile).—A nuclear chain reactor in which transmutation produces a greater number of fissionable atoms than the number of parent atoms consumed.

Brewster's law.—The tangent of the polarizing angle for a substance is equal to the index of refraction. The polarizing angle is that angle of incidence for which the reflected polarized ray is at right angles to the refracted ray. If n is the index of refraction and θ the polarizing angle, $n = \tan \theta$.

Brightness is measured by the flux emitted per unit emissive area as projected on a plane normal to the line of sight. The unit of brightness is that of a perfectly diffusing surface giving out one lumen per square centimeter of projected surface and is called the lambert. The millilambert (0.001 lambert) is a more convenient unit. **Candle per square centimeter** is the brightness of a surface which has, in the direction considered, a luminous intensity of one candle per cm^2.

British thermal unit.—The quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit at, or near, its point of maximum density (39.1°F). The Btu is equivalent to 0.252 kilogram-calorie.

Brownian movement.—A continuous agitation of particles in a colloidal solution caused by unbalanced impacts with molecules of the surrounding medium. The motion may be observed with a microscope when a strong beam of light is caused to traverse the solution across the line of sight.

Bulk modulus.—The modulus of volume elasticity,

$$M_B = \frac{p_2 - p_1}{\frac{v_1 - v_2}{v_1}}$$

where p_1, p_2; v_1, v_2 are the initial and final pressure and volume respectively.

Calorie.—The amount of heat necessary to raise 1 gram of water at 15°C, 1°C. There are various calories depending upon the interval chosen. Sometimes the unit is written as the gram-calorie or the kilogram calorie, the meaning of which is evident. The calorie may be defined in terms of its mechanical equivalent. The National Bureau of Standards defines the calorie as

DEFINITIONS AND FORMULAS (Continued)

4.18400 joules. At the International Steam Table Conference held in London in 1929 the international calorie was defined at $\frac{1}{860}$ of the international watt hour, which makes it equal to 4.1860 international joules.

With the adoption of the absolute sytem of electrical units, this becomes 1/859.858 watt hours or 4.18674 joules. The Btu was defined at the same time as 251.996 international calories.

Calutron.—An apparatus operating on the principle of the mass spectrograph and used for separating U^{235} from U^{238}.

Candle (or International Candle).—The candle is the unit of luminous intensity. It is a specified fraction of the average horizontal candlepower of a group of 45 carbon-filament lamps preserved at the Bureau of Standards.

Candle (new unit).—$\frac{1}{60}$ of the intensity of one square centimeter of a blackbody radiator at the temperature of solidification of platinum (2,046°K).

Capacitance is measured by the charge which must be communicated to a body to raise its potential one unit. Electrostatic unit capacitance is that which requires one electrostatic unit of charge to raise the potential one electrostatic unit. The farad = 9×10^{11} electrostatic units. A capacitance of one farad requires one coulomb of electricity to raise its potential one volt. Dimensions,—$[\epsilon\, l]$; $[\mu^{-1}\, l^{-1}\, t^2]$.

A conductor charged with a quantity Q to a potential V has a capacitance,

$$C = \frac{Q}{V}$$

Capacitance of a spherical conductor of radius r,

$$C = Kr$$

Capacitance of two concentric spheres of radii r and r'

$$C = K\frac{rr'}{r - r'}$$

Capacitance of a parallel plate condenser, the area of whose plates is A and the distance between them d,

$$C = \frac{KA}{4\pi d}$$

Capacitances will be given in electrostatic units if the dimensions of condensers are substituted in cm. K is the dielectric constant of the medium.

Capillary constant or specific cohesion,

$$a^2 = \frac{2T}{(d_1 - d_2)g} = hr$$

where T is surface tension, d_1 and d_2, the densities of the two fluids, g the acceleration due to gravity, h the height of rise in a capillary tube of radius r.—See *Surface tension*

Carnot cycle.—A sequence of operations forming the working cycle of an ideal heat engine of maximum thermal efficiency. It consists of isothermal expansion, adiabatic expansion, isothermal compression, and adiabatic compression to the initial state.

Catalytic agent.—A substance which by its mere presence alters the velocity of a reaction, and may be recovered unaltered in nature or amount at the end of the reaction.

Cathode.—The electrode at which reduction occurs. It is the negative electrode in a cell through which current is being forced, but it is the positive pole of a battery. In a vacuum tube, the cathode is the electrode from which electrons are liberated.—See *Anode*

Cation.—A positively charged ion.

Cauchy's dispersion formula.

$$n = A + \frac{B}{\lambda^2} + \frac{C}{\lambda^4} + \cdots$$

An empirical expression giving an approximate relation between the refractive index n of a medium and the wavelength λ of the light; A, B, and C being constants for a given medium.

Celsius.—See temperature, Celsius, in this section.

Centipoise.—A standard unit of *viscosity*, equal to 0.01 poise, the c.g.s. unit of viscosity. Water at 20°C has a viscosity of 1.002.

Centripetal force.—The force required to keep a moving mass in a circular path. Centrifugal force is the name given to the reaction against centripetal force.

Chain reaction.—In general, any self-sustaining process, whether molecular or nuclear, the products of which are instrumental in, and directly contribute to the propagation of the process. Specifically, a *fission chain reaction*, where the energy liberated or particles produced (fission products) by the fission of an atom cause the fission of other atomic nuclei, which in turn propagate the fission reaction in the same manner.

Charles' law or Gay-Lussac's law.—The volumes assumed by a given mass of a gas at different temperatures, the pressure remaining constant, are, within moderate ranges of temperature, directly proportional to the corresponding absolute temperatures.

Chemiluminescence.—Emission of light during a chemical reaction.

Christiansen effect. When finely powdered substances, such as glass or quartz, are immersed in a liquid of the same index of refraction complete transparency can only be obtained for monochromatic light. If white light is employed the transmitted color corresponds to the particular wave-length for which the two substances, solid and liquid have exactly the same index of refraction. Due to differences in dispersion the indices of refraction will match for only a narrow band of the spectrum.

Chromatic aberration.—Due to the difference in the index of refraction for different wave lengths, light of various wave lengths from the same source cannot be focused at a point by a simple lens. This is called chromatic aberration.

Cloud chamber.—An apparatus containing moist air or other gas which on sudden expansion condenses moisture to droplets on dust particles or other nuclei. Thus charged particles or ions in the space become nuclei and their numbers and behavior, when properly illuminated, may be studied.

Colligative property.—A property numerically the same for a group of substances, independent of their chemical nature.

Colloid.—A phase dispersed to such a degree that the surface forces become an important factor in determining its properties.

In general particles of colloidal dimensions are approximately 10 angstroms to 1 micron in size. Colloidal particles are often best distinguished from ordinary molecules due to the fact that colloidal particles cannot diffuse through membranes which do allow ordinary molecules and ions to pass freely.

Coma.—An aberration of spherical lenses, occurring in the case of oblique incidence, when the bundle of rays forming the image is unsymmetrical. The image of a point is comet shaped, hence the name.

Combination frequencies.—Two vibrations of arbitrary frequencies f_1 and f_2 when applied simultaneously to a nonlinear (distorting) device will excite it to a motion containing not only the original frequencies, but also members of a set of "combination" frequencies given by $f_c = mf_1 + nf_2$ where m and n are integers. A resonator sharply tuned to any one of these frequencies which may be produced in the nonlinear device will resound to it with an amplitude depending on the type of nonlinearity. The superheterodyne radio receiver depends on this phenomenon.

Combining volumes.—Under comparable conditions of pressure and temperature the volume ratios of gases involved in chemical reactions are simple whole numbers.

Combining weight of an element or radical is its atomic weight divided by its valence.

Combining weights, law of.—If the weights of elements which combine with each other be called their "combining weights," then elements always combine either in the ratio of their combining weights or of simple multiples of these weights.

Component substances, law of.—Every material consists of one substance, or is a mixture of two or more substances, each of which exhibits a specific set of properties, independent of the other substances.

Compounds are substances containing more than one constituent element and having properties, on the whole, different from those which their constituents had as elementary substances. The composition of a given pure compound is perfectly definite, and is always the same no matter how that compound may have been formed.

Compressibility.—Reciprocal of the bulk modulus.

Compton effect, (Compton recoil effect).—Elastic scattering of photons by electrons results in decrease in frequency and increase of wave length of x-rays and gamma-rays when scattered by free electrons.

Concentration.—The amount of a substance in weight, moles, or equivalents contained in unit volume.

Condensers in parallel and series.—If c_1, c_2, c_3, etc. represent the capacitances of a series of condensers and C their combined capacitance,—

when in parallel, $C = c_1 + c_2 + c_3 \cdots$

when in series, $\frac{1}{C} = \frac{1}{c_1} + \frac{1}{c_2} + \frac{1}{c_3} \cdots$

Conductance, the reciprocal of resistance, is measured by the ratio of the current flowing through a conductor to the difference of potential between its ends. The practical unit of conductance, the mho, the conductance of a body through which one ampere of current flows when the potential difference is one volt. The conductance of a body in mho is the reciprocal of the value of its resistance in ohms. Dimensions,—$[\epsilon\ l\ t^{-1}]$. $[\mu^{-1}\ l^{-1}\ t]$.

Conductivity, electrical, is measured by the quantity of electricity transferred across unit area, per unit potential gradient per unit time. Reciprocal of resistivity. **Volume conductivity** or specific conductance, $k = 1/\rho$ where ρ is the volume resistivity. **Mass conductivity** $= k/d$ where d is density. **Equivalent conductivity** $\Lambda = k/c$ where c is the number of equivalents per unit volume of solution. **Molecular conductivity** $\mu = k/m$ where m is the number of moles per unit volume of solution. Dimensions: volume conductivity, $[\epsilon\ t^{-1}]$; $[\mu^{-1}\ l^{-2}\ t]$,—mass conductivity,—$[\epsilon\ m^{-1}\ l^3\ t^{-1}]$; $[\mu^{-1}\ m^{-1}\ lt]$.

Conductivity, thermal.—Time rate of transfer of heat by conduction, through unit thickness, across unit area for unit difference of temperature. It is measured as calories per second per square centimeter for a thickness of one centimeter and a difference of temperature of 1°C. Dimensions,—$[m\ l\ t^{-3}\ \theta^{-1}]$.

If the two opposite faces of a rectangular solid are maintained at temperatures t_1 and t_2 the heat conducted across the solid of section a and thickness d in a time T will be,

$$Q = \frac{K(t_2 - t_1)aT}{d}$$

K is a constant depending on the nature of the substance, designated as the specific heat conductivity. K is usually given for Q in calories, t_1 and t_2 in °C, a in cm², T in sec, and d in cm.—See *Heat conductivity*

Conductors.—A class of bodies which are incapable of supporting electric strain. A charge given to a conductor spread to all parts of the body.

Conjugate foci.—Under proper conditions light divergent from a point on or near the axis of a lens or spherical mirror is focused at another point. The point of convergence and the position of the source are interchangeable and are called conjugate foci.

Conservation of energy, (Chem).—In a chemical change there is no loss or gain but merely a transformation of energy from one form to another.

Conservation of energy, law of.—Energy can neither be created nor destroyed and therefore the total amount of energy in the universe remains constant.

Conservation of mass.—In all ordinary chemical changes, the total of the reactants is always equal to the total mass of the products.

Conservation of momentum, law of.—For any collision, the vector sum of the momenta of the colliding bodies after collison equals the vector sum of their momenta before collision. If two bodies of masses m_1 and m_2 have, before impact velocities v_1 and v_2 and after impact velocities u_1 and u_2

$$m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$$

Constitutive property.—A property which depends on the constitution or structure of the molecule.

Cooling.—Processing highly radioactive materials to attain lesser radioactivity for subsequent use or handling.

Cosmic rays.—Highly penetrating radiations which strike the earth, assumed to originate in interstellar space. They are classed as: primary, coming from the assumed source, and secondary, those induced in upper atmospheric nuclei by collisions with primary cosmic rays.

Cosmotron.—A particle accelerator capable of giving them energies to billions of electron volts.

Coulomb.—A unit quantity of electricity. It is the quantity of electricity which must pass through a circuit to deposit 0.0011180 grams of silver from a solution of silver nitrate. An ampere is one coulomb per second. A coulomb is also the quantity of electricity on the positive plate of a condenser of one-farad capacity when the electromotive force is one volt.

Couple.—Two equal and oppositely directed parallel but not colinear forces acting upon a body form a couple. The moment of the couple or torque is given by the product of one of the forces by the perpendicular distance between them. Dimension, $-[m\ l^2\ t^{-2}]$.

Couple acting on a magnet of magnetic moment ml in a field of strength H. If the magnet is perpendicular to the direction of the field

$$C = Hml = HM$$

If the angle between the magnet and the field is θ

$$C = Hml \sin \theta$$

The couple will be in dyne-cm for cgs electromagnetic units of H, m and l.

Critical mass.—The minimum mass the fissile material must have in order to maintain a spontaneous fission chain reaction. For pure U^{235} it is computed to be about 20 pounds.

Critical temperature is that temperature above which a gas cannot be liquefied by pressure alone. The pressure under which a substance may exist as a gas in equilibrium with the liquid at the critical temperature is the **critical pressure.**

Cross section, (Nuclear cross section).—A measure of the probability of a particular process. The nuclear cross section is expressed by a/bc, where a is the number of processes occurring, b the number of incident particles, and c the number of target nuclei per cm^2. There are nuclear cross sections for fission, for slow neutron capture, for Compton collision, and for ionization by electron impact.

Cryohydrate.—The solid which separates when a saturated solution freezes. It contains the solvent and the solute in the same proportions as they were in the saturated solution.

Crystal.—The "ideal crystal" is a homogeneous portion of crystalline matter, (q.v.) whether bounded by faces or not.

Crystalline matter is matter that possesses a triperiodic structure on the atomic scale. It is characterized by discontinuous vectorial properties that give rise to "crystal planes" [(1) crystal growth (faces); (2) cohesion (cleavage planes); (3) twinning (twin planes); (4) gliding (gliding planes); (5) x-ray, electron, or neutron diffraction ("reflecting" planes); all of which are parallel to lattice planes.]

Curie.—Unit for measuring radioactivity. One Curie = that quantity of any radioactive isotope undergoing 3.7×10^{10} disintegrations per second.

Curie's law.—The intensity of magnetization,

$$I = \frac{AH}{T}$$

where H, is the magnetic field strength, T the absolute temperature and A Curie's constant. Used for paramagnetic substances.

Curie point.—All ferro-magnetic substances have a definite temperature of transition at which the phenomena of ferromagnetism disappear and the substances become merely paramagnetic. This temperature is called the "Curie Point" and is usually lower than the melting point.

Curie-Weiss law.—The Curie law was modified by Weiss to state that the susceptibility of a paramagnetic substance above the Curie point varies inversely as the excess of the temperature above that point.

This law is not valid at or below the Curie point.

Current (electric).—The rate of transfer of electricity. The transfer at the rate of one electrostatic unit of electricity in one second is the electrostatic unit of current. The electromagnetic unit of current is a current of such strength that one centimeter of the wire in which it flows is pushed sideways with a force of one dyne when the wire is at right angles to a magnetic field of unit intensity. The practical unit of current is the **ampere,** a transfer of one coulomb per second, which is one tenth the electromagnetic unit. The **international ampere** is the unvarying electric current which, when passed through a solution of silver nitrate in accordance with certain specifications, deposits silver at the rate of 0.00111800 gram per second. The international ampere is equivalent to 0.999835 absolute ampere. The **ampere-turn** is the magnetic potential produced between the two faces of a coil of one turn carrying one ampere. Dimensions,—$[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-2}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-1}]$.

Current in a simple circuit.—The current in a circuit including an external resistance R and a cell of electromotive force E and internal resistance r,

$$I = \frac{E}{R + r}$$

If E is in volts and r and R in ohms the current will be in amperes.

For two cells in parallel,

$$I = \frac{E}{R + \frac{r}{2}}$$

For two cells in series,

$$I = \frac{2E}{R + 2r}$$

Cyclotron.—The magnetic resonance accelerator for imparting very great velocities to heavier nuclear particles without the use of excessive voltages.

Dalton's law of partial pressures.—The pressure exerted by a mixture of gases is equal to the sum of the separate pressures which each gas would exert if it alone occupied the whole volume. This fact is expressed in the following formula:

$$PV = V(p_1 + p_2 + p_3, \text{ etc.})$$

Decay.—Diminution of a radioactive substance due to nuclear emission of alpha or beta particles, gamma rays or positrons.

Declination.—The angle between the vertical plane containing the direction of the earth's field at any point and a plane containing the geographic north and south meridian.

Decomposition is the chemical separation of a substance into two or more substances, which may differ from each other and from the original substances.

Definite proportions, law of.—In every sample of each compound substance the proportions by weight of the constituent elements are always the same.

Degree of freedom.—The number of the variables determining the state of a system (usually pressure, temperature, and concentrations of the components) to which arbitrary values can be assigned.

Density.—Concentration of matter, measured by the mass per unit volume. Dimensions,—$[m\ l^{-3}]$.

Deuteron.—Nucleus of the deuterium atom or the ion of deuterium. Its structure—one neutron and one proton.

Dew point.—The temperature at which condensation of water vapor in the air takes place.

Diamagnetic materials.—Are those within which an externally applied magnetic field is slightly reduced because of an alteration of the atomic electron orbits produced by the field. Diamagnetism is an atomic-scale consequence of the Lenz law of induction. The permeability of diagmagnetic materials is slightly less than that of empty space.

Dielectric constant of a medium is defined by ϵ in the equation

$$F = \frac{QQ'}{\epsilon r^2}$$

where F is the force of attraction between two charges Q and Q' separated by a distance r in a uniform medium.

Dielectrics or insulators or non-conductors.—A class of bodies supporting an electric strain. A charge on one part of a non-conductor is not communicated to any other part.

Diffraction.—That phenomena produced by the spreading of waves around and past obstacles which are comparable in size to their wavelength.

Diffraction grating.—If s is the distance between the rulings, d the angle of diffraction, then the wave length where the angle of incidence is 90° is (for the nth order spectrum),

$$\lambda = \frac{s \sin d}{n}$$

If i is the angle of incidence, d the angle of diffraction, s the distance between the rulings, n the order of the spectrum, the wave length is, $\lambda = \frac{s}{n}(\sin i + \sin d)$.

Diffusion.—If the concentration (mass of solid per unit volume of solution) at one surface of a layer of liquid is d_1 and at the other surface d_2, the thickness of the layer h and the area under consideration A, then the mass of the substance which diffuses through the cross-section A in time t is,

$$m = \Delta A \frac{(d_2 - d_1)t}{h}$$

where Δ is the coefficient of diffusion.

Diffusivity or coefficient of diffusion is also given by Δ in the equation

$$\frac{dQ}{dt} = -\Delta \left(\frac{dc}{dx}\right) dy\, dz$$

where dQ is the amount passing through an area $dy\, dz$ in the direction of x in a time dt where dc/dx is the rate of increase of volume concentration in the direction of x. Dimensions,—$[l^2\, t^{-1}]$.

Diffusivity of heat is given by Δ in the equation

$$\frac{dH}{dt} = -\Delta s d \frac{dT}{dx}\, dy\, dz$$

where dH is the quantity of heat passing through the area $dy\, dz$ in the direction of x in a time dt. The rate of variation of temperature along x is given by dT/dx, s is specific heat and d, density. Dimensions,—$[l^2\, t^{-1}]$.

Dimensional formulae.—If mass, length, and time are considered fundamental quantities, the relation of other physical quantities and their units to these three may be expressed by a formula involving the symbols l, m and t respectively, with appropriate exponents. For example; the dimensional formula for volume would be expressed,—$[l^3]$; velocity,—$[lt^{-1}]$; force—$[m\, lt^{-2}]$. Other fundamental quantities used in dimensional formulae may be indicated as follows: θ, temperature, ϵ the dielectric constant of a vacuum; μ, the magnetic permeability of a vacuum.

Diminution of pressure at the side of a moving stream. If a fluid of density d moves with a velocity v, the diminution of pressure due to the motion is (neglecting viscosity),

$$p = \tfrac{1}{2}\, dv^2$$

Dip.—The angle measured in a vertical plane between the direction of the earth's magnetic field and the horizontal.

Dipole.—(1) A combination of two electrically or magnetically charged particles of opposite sign which are separated by a very small distance. (2) Any system of charges, such as a circulating current, which has the properties that: (a) no forces act on it in a uniform field; (b) a torque proportional to $\sin \theta$, where θ is the angle between the dipole axis and a uniform field, does act on it; (c) it produces a potential which is proportional to the inverse square of the distance from it.

Dipole moment.—A mathematical entity; the product of one of the charges of a dipole unit by the distance separating the two dipolar charges. In terms of the definition of a dipole (2), the dipole moment **p** is related to the torque **T**, and the field strength **E** (or **B**) through the equation:

$$\mathbf{T} = \mathbf{p} \times \mathbf{E}.$$

Dipole moment, molecular.—It is found from measurements of dielectric constant (i.e. by its temperature dependence, as in the **Debye equation for total polarization**) that certain molecules have permanent dipole moments. These moments are associated with transfer of charge within the molecule, and provide valuable information as to the molecular structure.

Dispersion.—The difference between the index of refraction of any substance for any two wave lengths is a measure of the dispersion for these wave lengths, called the coefficient of dispersion.

Dispersion forces.—The force of attraction between molecules possessing no permanent **dipole.** The interaction energy is given by

$$U_D = -\frac{3}{4}\, h\, \frac{V_0 \alpha^2}{r^6}$$

where h is Planck's constant, V_0 a characteristic frequency of the molecule, r the distance between the molecules, and α the polarizability.

Dispersive power.—If n_1 and n_2 are the indices of refraction for wave lengths λ_1 and λ_2 and n the mean index or that for sodium light, the dispersive power for the specified wave length is,

$$\omega = \frac{n_2 - n_1}{n - 1}$$

Displacement is a reaction in which an elementary substance displaces and sets free a constituent element from a compound.

Displacement or elongation at any instant. The distance of a vibrating or oscillating particle from its position of equilibrium.

Distribution law.—A substance distributes itself between two immiscible solvents so that the ratio of its concentrations in the two solvents is approximately a constant (and equal to the ratio of the solubilities of the substance in each solvent). The above statement requires modification if more than one molecular species is formed.

Doppler effect, (Light).—The apparent change in the wave-length of light produced by the motion in the line of sight of either the observer or the source of light.

Doppler effects.—Effects on the apparent frequency of a wave train produced (1) by motion of the source toward or away from the stationary observer, and (2) by motion of the observer toward or from the stationary source; the motion in each case being with reference to the (supposedly stationary) medium.

For sound waves, the observed frequency f_0, in cycles/sec., is given by

$$f_0 = \frac{v + w - v_0}{v + w - v_s} f_s$$

where v is the velocity of sound in the medium, v_0 is the velocity

of the observer, v_o is the velocity of the source, w is the velocity of the wind in the direction of sound propagation, and f_s is the frequency of source.

For optical waves

$$f_0 = f_s \sqrt{\frac{c + v_r}{c - v_r}}$$

where v_r is the velocity of the source relative to the observer and c is the speed of light.

Dosimeter.—A gadget worn by those who work about radioactive sources to record the amount of exposure the wearer has had to radioactivity.

Double decomposition consists of a simple exchange of the parts of two substances to form two new substances.

Dulong and Petit, law of.—The specific heats of the several elements are inversely proportional to their atomic weights. The atomic heats of solid elements are constant and approximately equal to 6.3. Certain elements of low atomic weight and high melting point have, however, much lower atomic heats at ordinary temperatures.

Dyne.—The force necessary to give acceleration of one centimeter per second per second to one gram of mass.

Eddy current.—A current induced in a mass of conducting material by a varying magnetic field. Also called *Foucault current.*

Einstein theory for mass-energy equivalence.—The equivalence of a quantity of mass m and a quantity of energy E by the formula $E = mc^2$. The conversion factor c^2 is the square of the velocity of light.

Elasticity.—The property by virtue of which a body resists and recovers from deformation produced by force.

Elastic limit.—The smallest value of the stress producing permanent alteration.

Elastic moduli.

Young's modulus by stretching.—If an elongation s is produced by the weight of the mass m, in a wire of length l, and radius r, the modulus,

$$M = \frac{mgl}{\pi r^2 s}$$

Young's modulus by bending, bar supported at both ends. If a flexure s is produced by the weight of mass m, added midway between the supports separated by a distance l, for a rectangular bar with vertical dimensions of cross-section a and horizontal dimension b, the modulus is,

$$M = \frac{mgl^3}{4sa^3b}$$

For a cylindrical bar of radius r,

$$M = \frac{mgl^3}{12\pi r^4 s}$$

For a bar supported at one end. In the case of a rectangular bar as described above,

$$M = \frac{4mgl^3}{sa^3b}$$

For a round bar supported at one end,

$$M = \frac{4mgl^3}{3\pi r^4 s}$$

Modulus of rigidity.—If a couple C $(= mgx)$ produces a twist of θ radians in a bar of length l and radius r, the modulus is

$$M = \frac{2Cl}{\pi r^4 \theta}$$

The substitution in the above formulae for the elastic coefficients of m in grams, g in cm per sec^2, l, a, b, and r in cm, s in cm, and C in dyne-cm will give moduli in dynes per cm^2. The dimensions of elastic moduli are the same as of stress,—$[m\, l^{-1}\, t^{-2}]$.

Coefficient of restitution.—Two bodies moving in the same straight line, with velocities v_1 and v_2 respectively, collide and after impact move with velocities v_3 and v_4. The coefficient of restitution is

$$C = \frac{v_4 - v_3}{v_2 - v_1}$$

Electric field intensity is measured by the force exerted on unit charge. Unit field intensity is the field which exerts the force of one dyne on unit positive charge. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$;.$[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-2}]$.

The field intensity or force exerted on unit charge at a point distant r from a charge q in a vacuum

$$H = \frac{q}{r^2}$$

If the dielectric in the above cases is not a vacuum the dielectric constant ϵ must be introduced. The formula becomes

$$H = \frac{q}{\epsilon r^2}$$

The value of ϵ is frequently considered unity for air. If the dielectric constant of a vacuum is considered unity the value for air at 0°C and 760 mm pressure is 1.000576.

Electrochemical equivalent of an ion is the mass liberated by the passage of unit quantity of electricity.

Electrolysis.—If a current i flows for a time t and deposits a metal whose electrochemical equivalent is e, the mass deposited is

$$m = eit$$

The value of e is usually given for mass in grams, i in amperes and t in seconds.

Electrolytic dissociation or ionization theory.—When an acid, base or salt is dissolved in water or any other dissociating solvent, a part or all of the molecules of the dissolved substance are broken up into parts called ions, some of which are charged with positive electricity and are called cations, and an equivalent number of which are charged with negative electricity and are called anions.

Electrolytic solution tension theory (or the Helmholtz double layer theory).—When a metal, or any other substance capable of existing in solution as ions, is placed in water or any other dissociating solvent, a part of the metal or other substances passes into solution in the form of ions, thus leaving the remainder of the metal or substances charged with an equivalent amount of electricity of opposite sign from that carried by the ions. This establishes a difference in potential between the metal and the solvent in which it is immersed.

Electromotive force is defined as that which causes a flow of current. The electromotive force of a cell is measured by the maximum difference of potential between its plates. The electromagnetic unit of potential difference is that against which one erg of work is done in the transfer of electromagnetic unit quantity. The **volt** is that potential difference against which one joule of work is done in the transfer of one coulomb. One volt is equivalent to 10^8 electromagnetic units of potential. The **international** volt is the electrical potential which when steadily applied to a conductor whose resistance is one international ohm will cause a current of one international ampere to flow. The international volt = 1.00033 absolute volts. The electromotive force of a Weston standard cell is 1.0183 int. volts at 20°C. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}]$, $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-2}]$.

Electromotive series is a list of the metals arranged in the decreasing order of their tendencies to pass into ionic form by losing electrons.

Electron.—The electron is a small particle having a unit negative electrical charge, a small mass, and a small diameter. Its charge is $(4.80294 \pm .00008) \times 10^{-10}$ absolute electrostatic units, its mass $\frac{1}{1837}$ that of the hydrogen nucleus, and its diameter about 10^{-12} cm. Every atom consists of one nucleus and one or more electrons. Cathode rays and Beta rays are electrons.

Electron-volt (ev).—Energy acquired by any charged particle carrying unit electronic charge when it falls through a potential difference of one volt. 1 electron-volt = $(1.60207 \pm .00007) \times 10^{-12}$ erg. Multiples of this unit are also in common use: the kilo-, million-, and billion electron-volt. 1 kev = 10^3 ev; 1 mev = 10^6 ev; and 1 bev = 10^9 ev.

An ev is associated through the Planck constant with a photon of wave length 1.2395 microns.

Elements are substances which cannot be decomposed by the ordinary types of chemical change, or made by chemical union.

Emissive power or emissivity is measured by the energy radiated from unit area of a surface in unit time for unit difference of temperature between the surface in question and surrounding bodies. For the cgs system the emissive power is given in ergs per second per square centimeter with the radiating surface at 1° absolute and the surroundings at absolute zero.—See *Radiation formula*

Enantiotropic.—Crystal forms capable of existing in reversible equilibrium with each other.

Energy.—The capability of doing work. **Potential energy** is energy due to position of one body with respect to another or to the relative parts of the same body. **Kinetic energy** is energy due to motion. Cgs units,—the erg, the energy expended when a force of one dyne acts through a distance of one centimeter; the joule is 1×10^7 ergs. Dimensions,—$[m\, l^2\, t^{-2}]$.

The potential energy of a mass m, raised through a distance h, where g is the acceleration due to gravity is

$$E = mgh.$$

The kinetic energy of mass m, moving with a velocity v, is

$$E = \tfrac{1}{2}mv^2$$

Energy will be given in ergs if m is in grams, g in cm per sec^2, h in cm and v in cm per sec.

Energy of a charge in ergs where Q is the charge and V the potential in electrostatic units.

$$E = \tfrac{1}{2}QV.$$

Energy of the electric field.—If H is the electric field intensity in electrostatic units and K the specific inductive capacity, the energy of the field in ergs per cm^3 is

$$E = \frac{KH^2}{8\pi}$$

Energy of rotation.—If a mass whose moment of inertia about an axis is I, rotates with angular velocity ω about this axis, the kinetic energy of rotation will be,

$$E = \tfrac{1}{2}I\omega^2$$

Energy will be given in ergs if I is in g-cm^2 and ω in radians per sec.

Enthalpy, or heat content, is a thermodynamic quantity. It is equal to the sum of the internal energy of a system plus

the product of the pressure-volume work done on the system. Thus

$$H = E + pv$$

where H = enthalpy or heat content
E = internal energy of the system
p = pressure
v = volume.

Entropy.—Entropy is the capacity factor for isothermally unavailable energy. The increase in the entropy of a body during an infinitesimal stage of a reversible process is equal to the infinitesimal amount of heat absorbed divided by the absolute temperature of the body. Thus for a reversible process

$$dS = \frac{Q}{T}$$

Every spontaneous process in nature is characterized by an increase in the total entropy of the bodies concerned in the process.

Equilibrium, chemical.—A state of affairs in which a chemical reaction and its reverse reaction are taking place at equal velocities, so that the concentrations of reacting substances remain constant.

Equilibrium constant.—The product of the concentrations (or activities) of the substances produced at equilibrium in a chemical reaction divided by the product of concentrations of the reacting substances, each concentration raised to that power which is the coefficient of the substance in the chemical equation.

Equivalent conductance of an electrolyte is defined as the conductance of a volume of solution containing one equivalent weight of dissolved substance when placed between two parallel electrodes 1 cm apart, and large enough to contain between them all of the solution. Λ is never determined directly, but is calculated from the specific conductance. If C is the concentration of a solution in gram equivalents per liter, then the concentration per cubic centimeter is C/1000, and the volume containing one equivalent of the solute is, therefore, 1000/C. Since L_s is the conductance of a centimeter cube of the solution, the conductance of 1000/C cc, and hence Λ will be

$$\Lambda = \frac{1000 L_s}{C}$$

Equivalent weight or combining weight of an element or ion is its atomic or formula weight divided by its valence. Elements entering into combination always do so in quantities proportional to their equivalent weights.

In oxidation-reduction reactions the equivalent weight of the reacting substances is dependent upon the change in oxidation number of the particular substance.

Ettinghausen's effect (Von Ettinghausen's).—When an electric current flows across the lines of force of a magnetic field an electromotive force is observed which is at right angles to both the primary current and the magnetic field: a temperature gradient is observed which has the opposite direction to the Hall electromotive force.

Eutectic.—A term applied to the mixture of two or more substances which has the lowest melting point.

Expansion of gases.

Charles' law or Gay-Lussac's law.—The volume of a gas at constant pressure increases proportionately to the absolute temperature. If V_1 and V_2 are volumes of the same mass of gas at absolute temperatures, T_1 and T_2,

$$\frac{V_1}{V_2} = \frac{T_1}{T_2}$$

For an original volume V_o at 0°C the volume at t°C (at constant pressure) is

$$V_t = V_o(1 + 0.00367t).$$

General law for gases.

$$p_t v_t = p_o v_o \left(1 + \frac{t}{273}\right)$$

where p_o, v_o, p_t, v_t represent the pressure and value at 0° and t°C or

$$\frac{p_1 v_1}{T_1} = \frac{p_2 v_2}{T_2}$$

where p_1, v_1 and T_1 represent pressure, volume and absolute temperature in one case and p_2, v_2 and T_2 the same quantities for the same mass of gas in another.

The law may also be expressed:

$$pv = RmT$$

where m is the mass of gas at absolute temperature T. R is the **gas constant** which depends on the units used. **Boltzmann's molecular gas constant** is obtained by expressing m in terms of the number of molecules.

For volume in cm^3, pressure in dynes per cm^2 and temperature in Centigrade degrees on the absolute scale $R = 8.3136 \times 10^7$.

Reduction of a gas volume to 0°C, 760 mm pressure.—If V is the original volume of a gas at temperature t and pressure H, the volume at 0°C and 760 mm pressure will be,

$$V_o = \frac{V}{(1 + \alpha t)} \frac{H}{760}$$

If d is the original density the density at 0°C and 760 mm pressure will be

$$d_o = d(1 + \alpha t) \frac{760}{H}$$

$\alpha = 0.00367$ approximately.

Falling bodies.—For bodies falling from rest conditions are as for uniformly accelerated motion except that $v_o = 0$ and g is the acceleration due to gravity. The formulae become,—air resistance neglected,

$$v_t = gt,\ s = \tfrac{1}{2}gt^2,\ v_s = \sqrt{2gs}.$$

For bodies projected vertically upward,—if v is the velocity of projection, the time to reach greatest height, neglecting the resistance of the air,

$$t = \frac{v}{g}$$

Greatest height,

$$h = \frac{v^2}{2g}$$

—See *Projectiles*

Faraday's laws.—In the process of electrolytic changes equal quantities of electricity charge or discharge equivalent quantities of ions at each electrode.

One gram equivalent weight of matter is chemically altered at each electrode for 96,501 int. coulombs, or one faraday, of electricity passed through the electrolyte.

Faraday effect.—The rotation of the plane of polarization produced when plane-polarized light is passed through a substance in a magnetic field, the light traveling in a direction parallel to the lines of force. For a given substance, the rotation is proportional to the thickness traversed by the light and to the magnetic field strength.

Faraday, new determination of (1960).—By the National Bureau of Standards which uses an electrochemical method that dissolves, rather than deposits, silver from a solution. The new value, 96,516 ± 2 coulombs (physical scale) or 96,489 ± 2 coulombs (chemical scale). NBS used its mass, time, and electrical standards in measuring the faraday, and have found that its value agreed within 22 p.p.m. with the one obtained by an independent physical method using the omegatron.

Fermat's principle.—The path followed by light (or other waves) passing through any collection of media from one specified point to another, is that path for which the time of travel is least.

Fission.—A nuclear reaction from which the atoms produced are each approximately half the mass of the parent nucleus. In other words, the atom is split into two approximately equal masses. There is also the emission of extremely great quantities of energy since the sum of the masses of the two new atoms is less than the mass of the parent heavy atom. The energy released is expressed by Einstein's equation.

Fleming's rule.—A simple rule for relating the directions of the flux, motion, and e.m.f. in an electric machine. The forefinger, second finger and thumb, placed at right-angles to each other, represent respectively the directions of flux, e.m.f., and motion or torque. If the right hand is used the conditions are those obtaining in a generator and if the left hand is used the conditions are those obtaining in a motor.

Fluidity.—The reciprocal of viscosity. The cgs unit is the rhe, the reciprocal of the poise. Dimensions,—$[m^{-1}\ lt]$.

Fluorescence.—The property of emitting radiation as the result of absorption of radiation from some other source. The emitted radiation persists only as long as the exposure is subjected to radiation which may be either electrified particles or waves. The fluorescent radiation generally has a longer wave length than that of the absorbed radiation. If the fluorescent radiation includes waves of the same length as that of the absorbed radiation it is termed resonance radiation.

Foot-candle.—Foot-candle = 1 lumen incident per foot^2 = 1.076 milliphots = 10.76 lux.

Foot-lambert is the unit of photometric brightness (luminance) equal to $1/\pi$ candle per square foot.

Force.—That which changes the state of rest or motion in matter, measured by the rate of change of momentum. Absolute unit,—the **dyne,** the force which will produce an acceleration of one centimeter per second per second in a gram mass. The gram weight or weight of a gram mass is the cgs gravitational unit. The poundal is that force which will give an acceleration of one foot per second per second to a pound mass. Dimensions,—$[m\ lt^{-2}]$.

The force F required to produce an acceleration a in a mass m is given by

$$F = ma.$$

If m is substituted in grams and a in cm per sec^2, F will be given in dynes.

Force between two charges, Coulomb's law.—If two charges q and q' are at a distance r in a vacuum, the force between them is,

$$F = \frac{qq'}{r^2}$$

The force will be given in dynes if q and q' are in electrostatic units and r in cm.

Force between two magnetic poles.—If two poles of strength m and m' are separated by a distance r in a medium whose permeability is μ (unity for a vacuum), the force between them is,

$$F = \frac{mm'}{\mu r^2}$$

Force will be given in dynes if r is in cm and m and m' are in cgs units of pole strength.

The strength of a magnetic field at a point distance r from an isolated pole of strength m is

$$H = \frac{m}{\mu r^2}$$

The field will be given in gauss if m and r are in cgs units.

Formula, chemical.—A combination of symbols with their subscripts representing the constituents of a substance and their proportions by weight.

Fraunhofer's lines.—When sunlight is examined through a spectroscope it is found that the spectrum is traversed by an enormous number of dark lines parallel to the length of the slit. These dark lines are known as Fraunhofer's lines. Kirchoff conceived the idea that the sun is surrounded by layers of vapors which act as filters of the white light arising from incandescent solids within and which abstract those rays which correspond in their periods of vibration to those of the components of the vapors. Thus reversed or dark lines are obtained due to the absorption by the vapor envelop, in place of the bright lines found in the emission spectrum.

Frequency in uniform circular motion or in any periodic motion is the number of revolutions or cycles completed in unit time. Cgs units,—cycles per second. Dimension,—$[t^{-1}]$.

Frequency of vibrating strings.—The fundamental frequency of a stretched string is given by

$$n = \frac{1}{2l}\sqrt{\frac{T}{m}}$$

where l is the length, T, the tension and m the mass per unit length.

For a string or wire of circular section of length l, tension T, density d, and radius r, the frequency of the fundamental is

$$n = \frac{1}{2rl}\sqrt{\frac{T}{\pi d}}$$

The frequency in vibrations per second will be given if T is in dynes, r and l in cm and d in g per cm^3.

Friction, coefficient of.—The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the total force pressing the two together.

If F is the force required to move one surface over another and W, the force pressing the surfaces together, the coefficient of friction,

$$k = \frac{F}{W}$$

Fundamental units.—See *Mass, Length and Time*

Fusion (atomic).—A nuclear reaction involving the combination of smaller atomic nuclei or particles into larger ones with the release of energy from mass transformation. This is also called a thermo-nuclear reaction by reason of the extremely high temperature required to initiate it.

Gal.—1 gal = cm/sec./sec. Therefore, where the value of gravity is 980 this is the same as 980 gals. The milligal is now quite commonly used since it is approximately one part in a million of the normal gravity of the earth.

Gamma (γ) rays (nuclear x-rays).—May be emitted from radioactive substances. They are quanta of electromagnetic wave energy similar to but of much higher energy than ordinary x-rays. The energy of a quantum is equal to $h\nu$ ergs, where h is Planck's constant (6.6254×10^{-27} erg sec) and ν is the frequency of the radiation. Gamma rays are highly penetrating, an appreciable fraction being able to traverse several centimeters of lead.

Gas.—A state of matter in which the molecules are practically unrestricted by cohesive forces. A gas has neither definite shape nor volume.

Gas thermometer.—Where P_o, P_s and P_x represent the total pressure with the bulb at 0°C, at the boiling-point of water and at the unknown temperature respectively, t_s the temperature of steam and t_x the unknown temperature,

$$t_x = t_s \frac{P_x - P_o}{P_s - P_o}$$

(approximately). The total pressure on the gas in the bulb is the algebraic sum of barometric pressure at the time and that measured by the manometer.

Gauss.—The cgs emu of magnetic induction (flux density). It is equal to 1 maxwell per cm^2. It has such a value that if a conductor 1 cm long moves through a magnetic field at a velocity of 1 cm, in an induction mutually perpendicular, the induced emf is one abvolt.

Gay-Lussac's law.—See *Charles' law*

Gay-Lussac's law of combining volumes.—If gases interact and form a gaseous product, the volumes of the reacting gases and the volumes of the gaseous products are to each other in simple proportions, which can be expressed by small whole numbers.

Geiger counter.—Detector for radioactivity depending upon ionized particles that affect its mechanism. As its name indicates, it both detects and makes a count of them possible.

Gibbs' phase rule.—$F = C + 2 - P$, F, the number of degrees of freedom of a system, is the number of variable factors (temperature, pressure and concentration) of the components, which must be arbitrarily fixed in order that the condition of the system may be perfectly defined. C, the number of the components of the system, is chosen equal to the smallest number of independently variable constituents by means of which the composition of each phase participating

in the state of equilibrium can be expressed in the form of a chemical equation; the components must be chosen from among the constituents which are present when the system is in a state of true equilibrium and which take part in that equilibrium; as components are chosen the smallest number of such constituents necessary to express the composition of each phase participating in the equilibrium, zero and negative quantities of components being permissible; in any system the number of components is definite, but may alter with changes in conditions of experiment; a qualitative but not quantitative freedom of selection of components is allowed, the choice being influenced by suitability and simplicity of application. *P*, the number of phases of the system, are the homogeneous, mechanically separable and physically distinct portions of a heterogeneous system; the number of phases capable of existence varies greatly in different systems; there can never be more than one gas or vapor phase since all gases are miscible in all proportions, a heterogeneous mixture of solid substances forms as many phases as there are substances present.

Gilbert.—The cgs emu of magnetomotive force. 1 gilbert $= 10/4\pi$ ampere-turns.

Graham's law.—The relative rates of diffusion of gases under the same conditions are inversely proportional to the square roots of the densities of those gases.

Gram atom or gram atomic weight.—The mass in grams numerically equal to the atomic weight.

Gram equivalent of a substance is the weight of a substance displacing or otherwise reacting with 1.008 grams of hydrogen or combining with one-half of a gram atomic weight (8.00 grams) of oxygen.

Gram mole, gram formula weight, gram equivalent.—Mass in grams numerically equal to the molecular weight, formula weight or chemical equivalent, respectively.

Gram molecular weight or gram molecule.—A mass in grams of a substance numerically equal to its molecular weight. Gram mole.

Gravitation.—The universal attraction existing between all material bodies. The force of attraction between two masses m and m', separated by a distance r, k being the constant of gravitation,

$$F = k\frac{mm'}{r^2}$$

(If m and m' are given in grams, and r in centimeters, F will be in dynes if $k = 6.670 \times 10^{-8}$.)

Half-life.—Used to measure the rate of radioactive decay of disintegration. The time lapse during which a radioactive mass loses one half of its radioactivity.

Hall effect.—When a steady current is flowing in a steady magnetic field, electromotive forces are developed which are at right angles both to the magnetic force and to the current and are proportional to the product of the intensity of the current, the magnetic force and the sine of the angle between the directions of these quantities.

Hardness.—Property of substances determined by their ability to abrade or indent one another. An arbitrary scale of hardness is based upon ten selected minerals. For metals the diameter of the indentation made by a hardened steel sphere (Brinnell) or the height of rebound of a small drop hammer (Shore Scleroscope) serve to measure hardness.

Harmonic motion.—See *Simple harmonic motion and Angular harmonic motion*

Heat capacity.—That quantity of heat required to increase the temperature of a system or substance one degree of temperature. It is usually expressed in calories per degree centigrade.

Molar heat capacity is the quantity of heat necessary to raise the temperature of one molecular weight of the substance one degree.

Heat effect.—The heat in calories developed in a circuit by an electric current of I amperes flowing through a resistance of R ohms, with a difference of potential E volts for a time t seconds.

$$H = \frac{RI^2t}{4.18} = \frac{Eit}{4.18}$$

Heat equivalent, or latent heat, of fusion.—The quantity of heat necessary to change one gram of solid to a liquid with no temperature change. Dimensions,—$[l^2\, t^{-2}]$.

Heat of combustion of a substance is the amount of heat evolved by the combustion of 1 gram molecular weight of the substance.

Heat quantity.—The cgs unit of heat is the **calorie,** the quantity of heat necessary to change the temperature of one gram of water from 3.5°C to 4.5°C (called a small calorie). If the temperature change involved is from 14.5 to 15.5°C, the unit is the normal calorie. The mean calorie is $\frac{1}{100}$ the quantity of heat necessary to raise one gram of water from 0°C to 100°C. The large calorie is equal to 1000 small calories. The British thermal unit is the heat required to raise the temperature of one pound of water at its maximum density, 1°F. It is equal to about 252 calories. Dimensions of energy,—$[m\, l^2\, t^{-2}]$.

Hehner number (value).—A number expressing the percentage (i.e. grams per hundred grams) of water-insoluble fatty acids in an oil or fat.

Heisenberg's theory of atomic structure.—The currently accepted view of the structure of atom, formulated by Heisenberg in 1934, according to which the atomic nuclei are built of nucleons, which may be protons or neutrons, while the extranuclear shells consist of electrons only. The nucleons

are held together by nuclear forces of attraction, with exchange forces operating between them. The number of protons is equal to the atomic number (Z) of the element, the number of neutrons is equal to the difference between the mass number and the atomic number ($A - Z$). The number of excess neutrons, i.e. the excess of neutrons over protons, is of paramount importance for the radioactive properties or stability of the element.

Henry's law.—The mass of a slightly soluble gas that dissolves in a definite mass of a liquid at a given temperature is very nearly directly proportional to the partial pressure of that gas. This holds for gases which do not unite chemically with the solvent.

Hess' law of constant heat summation.—The amount of heat generated by a chemical reaction is the same whether reaction takes place in one step or in several steps, or all chemical reactions which start with the same original substances and end with the same final substances liberate the same amounts of heat, irrespective of the process by which the final state is reached.

Hooke's law.—Within the elastic limit of any body the ratio of the stress to the strain produced is constant.

Humidity, absolute.—Mass of water vapor present in unit volume of the atmosphere, usually measured as grams per cubic meter. It may also be expressed in terms of the actual pressure of the water vapor present.

Huygens' theory of light.—This theory states that light is a disturbance traveling through some medium, such as the ether. Thus light is due to wave motion in ether.

Every vibrating point on the wave-front is regarded as the center of a new disturbance. These secondary disturbances traveling with equal velocity, are enveloped by a surface identical in its properties with the surface from which the secondary disturbances start and this surface forms the new wave-front.

Hydrogen equivalent of a substance is the number of replaceable hydrogen atoms in 1 molecule or the number of atoms of hydrogen with which 1 molecule could react.

Hydrogen ion concentration.—The concentration of hydrogen ions in solution when the concentration is expressed as gram-ionic weights per liter. A convenient form of expressing hydrogen ion concentration is in terms of the negative logarithm of this concentration. The negative logarithm of the hydrogen ion concentration is called pH. The significance of pH is still in dispute (ref. J. Am. Chem. Soc. 60, 1094 (1938)).

Water at 25°C has a concentration of H ion of 10^{-7} and of OH ion of 10^{-7} moles per liter. Thus the pH of water is 7 at 24°C. A greater accuracy is obtained if one substitutes the thermodynamic activity of the ion for its concentration.

Hydrolysis is a double decomposition reaction involving the splitting of water into its ions and the formation of a weak acid or base or both.

Hydrostatic pressure at a distance h from the surface of a liquid of density d,

$$P = hdg.$$

The total force on an area A due to hydrostatic pressure,

$$F = PA = Ahdg.$$

Force in dynes and pressure in dynes per cm² will be given if h is in cm, d in g per cm³ and g in cm per sec².

Hyperon.—Any article with mass intermediate between that of the neutron and the deuteron.—See *Meson*

Hysteresis.—The magnetization of a sample of iron or steel due to a magnetic field which is made to vary through a cycle of values, lags behind the field. This phenomenon is called hysteresis.

Steinmetz' equation for hysteresis gives the loss of energy in ergs per cycle per cm³,

$$W = \eta B^{1.6}$$

where B is the maximum induction in maxwells per cm² and η the coefficient of hysteresis.

Illumination on any surface is measured by the luminous flux incident on unit area. The units in use are: the **lux,** one lumen per square meter; the **phot,** one lumen per square centimeter and the lumen per square foot. Since at unit distance from a point source of unit intensity the illumination is unity, unit illumination may be defined as that produced by a unit source at unit distance, hence the **meter-candle** or **candle-meter** which is equal to the lux and the **foot-candle** equivalent to one lumen per square foot.

Indeterminancy principle (Uncertainty principle).—The postulate that it is impossible to determine simultaneously both the exact position and the exact momentum of an electron. So this aspect of electronics can only be expressed as a probability.

Index of refraction for any substance is the ratio of the velocity of light in a vacuum to its velocity in the substance. It is also the ratio of the sine of the angle of incidence to the sine of the angle of refraction. In general, the index of refraction for any substance varies with the wave length of the refracted light.

Indicators are substances which change from one color to another when the hydrogen ion concentration reaches a certain value, different for each indicator.

Induced electromotive force in a circuit is proportional to the rate of change of magnetic flux through the circuit.

$$E = -\frac{d\phi}{dt}$$

where $d\phi$ is the change of magnetic flux in a time dt. The induced current will be given by

$$I = \frac{d\phi}{Rdt}$$

where R is the resistance of the circuit.

Inductance.—The change in magnetic field due to the variation of a current in a conducting circuit causes an induced counter electromotive force in the circuit itself. This phenomenon is known as **self-induction.** If an electromotive force is induced in a neighboring circuit the term mutual induction is used. Inductance may thus be distinguished as self- or mutual and is measured by the electromotive force produced in a conductor by unit rate of variation of the current. Units of inductance are the centimeter (absolute electromagnetic) and the henry, which is equal to 10^9 centimeters of inductance. The **henry** is that inductance in which an induced electromotive force of one volt is produced when the inducing current is changed at the rate of one ampere per second. Dimensions,—$[\epsilon^{-1}\, l^{-1}\, t^2]$; $[\mu l]$.

Induction.—Any change in the intensity or direction of a magnetic field causes an electromotive force in any conductor in the field. The induced electromotive force generates an induced current if the conductor forms a closed circuit.

Inertia.—The resistance offered by a body to a change of its state of rest or motion, a fundamental property of matter. Dimension,—$[m]$.

Intensity of illumination in candle meters of a screen illuminated by a source of illuminating power P candles at a distance r meters, for normal incidence,

$$I = \frac{P}{r^2}$$

If two sources of illuminating power P_1 and P_2 produce equal illumination on a screen when at distances r_1 and r_2 respectively,

$$\frac{P_1}{r_1^2} = \frac{P_2}{r_2^2} \quad \text{or} \quad \frac{P_1}{P_2} = \frac{r_1^2}{r_2^2}$$

If I_o is the intensity of illumination when the screen is normal to the incident light, I the intensity when an angle θ

$$I = I_o \cos \theta$$

Intensity of magnetization is given by the quotient of the magnetic moment of a magnet by its volume. Unit intensity of magnetization is the intensity of a magnet which has unit magnetic moment per cubic centimeter. Dimensions, $[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$.

Intensity of radiation is the rate of transfer of energy across unit areas by the radiation. In all forms of energy transfer by waves (radiation) the intensity I is given by $I = Uv$, where U is the energy density of the wave in the medium, and v is the velocity of propagation of the wave. The energy density U is always proportional to the square of the wave amplitude.

Intensity of sound depends upon the energy of the wave motion. The intensity is measured by the energy in ergs transmitted per second through one square centimeter of surface. The energy in ergs per cm³ in a sound wave is given by

$$E = 2\pi^2 d n^2 a^2$$

where d is density in g per cm³, n is frequency in vib. per sec and a is amplitude in cm. The energy reaching the ear in unit time will also be proportional to the velocity of propagation.

Iodine number (value).—A number expressing the percentage (i.e. grams per 100 grams) of iodine absorbed by a substance. It is a measure of the proportion of unsaturated linkages present and is usually determined in the analysis of oils and fats.

Ion.—An ion is an atom or group of atoms that is not electrically neutral but instead carries a positive or negative electric charge. Positive ions are formed when neutral atoms or molecules lose valence electrons; negative ions are those which have gained electrons.

Ionization potential.—The work (expressed in electron volts) required to remove a given electron from its atomic orbit and place it at rest at an infinite distance. It is customary to list values in electron volts (ev.) 1 ev. = 23,053 calories per mole.

Isobars.—For chemistry, elements of the same atomic mass but of different atomic numbers. The sum of their nucleons is the same but there are more protons in one than in the other.

Isomerism.—Existence of molecules having the same number and kinds of atoms but in different configurations.

Isothermal.—When a gas passes through a series of pressure and volume variations without change of temperature the changes are called isothermal. A line on a pressure-volume diagram representing these changes is called an isothermal line.

Isotopes.—Two or more nuclides having the same atomic number, hence constituting the same element, but differing in mass number. Isotopes of a given element have the same number of nuclear protons but differing numbers of neutrons. Naturally occurring chemical elements are usually mixtures of isotopes so that observed (non-integer) atomic weights are average values for the mixture.—See *Atomic number*

Joule-Thomson effect.—The cooling which occurs when a highly compressed gas is allowed to expand in such a way that no external work is done is known as the Joule-Thomson effect. This cooling is inversely proportional to the square of the absolute temperature.

Kepler's laws.

I. The planets move about the sun in ellipses, at one focus of which the sun is situated.

II. The radius vector joining each planet with the sun describes equal areas in equal times.

III. The cubes of the mean distances of the planets from the sun are proportional to the squares of their times of revolution about the sun.

Kerr effect.—When plane polarized light is incident on the pole of an electromagnet, polished so as to act like a mirror, the plane of polarization of the reflected light is not the same when the magnet is "on" as when it is "off." It was found that the direction of rotation was opposite to that of the currents exciting the pole from which the light was reflected.

Kinetic theory, expression for pressure.

$$P = \tfrac{1}{3}Nmv^2$$

where N is the number of molecules in unit volume, m the mass of each molecule and v^2 the mean square of the velocity of the molecules.

Kinetic theory of gases.—Gases are considered to be made up of minute, perfectly elastic particles which are ceaselessly moving about with high velocities, colliding with each other and with the walls of the containing vessel. The pressure exerted by a gas is due to the combined effect of the impacts of the moving molecules upon the walls of the containing vessel, the magnitude of the pressure being dependent upon the kinetic energy of the molecules and their number.

Kirchhoff's laws.

I. The algebraic sum of the currents which meet at any point is zero.

II. In any closed circuit the algebraic sum of the products of the current and the resistance in each conductor in the circuit is equal to the electromotive force in the circuit.

Kirchhoff's laws of radiation.—The relation between the powers of emission and the powers of absorption for rays of the same wave-length is constant for all bodies at the same temperature. First, a substance when excited by some means or other possess a certain power of emission; it tends to emit definite rays, whose wave-lengths depend upon the nature of the substance and upon the temperature. Second, the substance exerts a definite absorptive power, which is a maximum for the rays it tends to emit. Third, at a given temperature the ratio between the emissive and the absorptive power for a given wave-length is the same for all bodies, and is equal to the emissive power of a perfectly black body.

Kohlrausch's law.—When ionization is complete, the conductivity of an electrolyte is equal to the sum of the conductivities of the ions into which the substance dissociates.

Kundt's law.—On approaching an absorption band from the red side of the spectrum the refractive index is abnormally increased by the presence of the band, while the approach is from the blue side and the index is abnormally decreased.

Lambert is the unit of brightness equal to $1/\pi$ candle per square centimeter.

Lambert's law of absorption.—Each layer of equal thickness absorbs an equal fraction of the light which traverses it.

Lambert's law of illumination.—The illumination of a surface on which the light falls normally from a point source is inversely proportional to the square of the distance of the surface from the source. If the normal to the surface makes an angle with the direction of the rays, the illumination is proportional to the cosine of that angle.

Lanthanide series (Lanthanides).—Rare earth elements of atomic numbers 57 through 71, which have chemical properties similar to lanthanum (#57).

Latent heat of vaporization.—The quantity of heat necessary to change one gram of liquid to vapor without change of temperature, measured as calories per gram. Dimensions,—$[l^2\, t^{-2}]$.

Lattice energy.—The energy required to separate the ions of a crystal to an infinite distance from each other.

LeChatelier's principle.—If some stress is brought to bear upon a system in equilibrium, a change occurs, such that the equilibrium is displaced in a direction which tends to undo the effect of the stress.

Length, units of.—The centimeter, one of the three fundamental units of the cgs system, is one one-hundredth the length of the International Prototype Meter, at Paris, at zero degrees centigrade. The meter is 1,553,164.13 times the wave length of the red cadmium line in air, 760 mm pressure, 15°C. The standard in the British system is the yard, the prototype of which is kept by the British government. The United States standard yard is defined as $\frac{3600}{3937}$ meter.

Lenses.—For a single thin lens whose surfaces have radii of curvature r_1 and r_2 whose principal focus is F, the index of refraction n, and conjugate focal distances f_1 and f_2,

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} = (n-1)\left(\frac{1}{r_1} + \frac{1}{r_2}\right)$$

For a thick lens, of thickness t,

$$F = \frac{nr_1r_2}{(n-1)[n(r_1+r_2) - t(n-1)]}$$

Combinations of lenses.—If f_1 and f_2 are the focal lengths of two thin lenses separated by a distance d the focal length of the system,

$$F = \frac{f_1f_2}{f_1 + f - d}$$

Lenz's law.—When an electromotive force is induced in a conductor by any change in the relation between the conductor and the magnetic field, the direction of the electromotive force is such as to produce a current whose magnetic field will oppose the change.

Line of force.—A term employed in the description of an electric or magnetic field. A line such that its direction at every point is the same as the direction of the force which would act on a small positive charge (or pole) placed at that point. A line of force is defined as starting from a positive charge (or pole) and ending on a negative charge (or pole).

The line (of force) is also used as a unit of magnetic flux, equivalent to the maxwell.

Lissajous figures.—The path described by a particle which is simultaneously displaced by two simple harmonic motions at right angles, when the periods of the two motions are in the ratio of two small whole numbers, shows a variety of characteristic curves called Lissajous figures.

Liquid.—A state of matter in which the molecules are relatively free to change their positions with respect to each other but restricted by cohesive forces so as to maintain a relatively fixed volume.

Loschmidt's number.—The number of molecules per unit volume of an ideal gas at 0°C and normal atmospheric pressure.

$$n_0 = (2.68719 \pm 0.0001) \times 10^{19}\ \mathrm{cm}^{-3}$$

Loudness.—The psychological response of the ear which is related to the physical quantity *intensity*. The loudness of a sound depends on frequency also since the ear responds more strongly to some frequency bands than to others. The loudness is roughly related to the cube root of the intensity, and for many purposes it is convenient to represent loudness as proportional to the logarithm of the intensity.

Lumen.—The lumen is the unit of luminous flux. It is equal to the luminous flux through a unit-solid angle (steradian) from a uniform point source of one candle, or to the flux on a unit surface all points of which are at unit distance from a uniform point source of one candle.

Luminous flux.—The total visible energy emitted by a source per unit time is called the total luminous flux from the source. The unit of flux, the **lumen,** is the flux emitted in unit solid angle (steradian) by a point source of one candle luminous intensity. A uniform point source of one candle intensity thus emits 4π lumens.

Luminous intensity or candle-power is the property of a source of emitting luminous flux and may be measured by the luminous flux emitted per unit solid angle. The accepted unit of luminous intensity is the **international candle.** The **Hefner unit,** which is equivalent to 0.9 international candles, is the intensity of a lamp of specified design burning amyl acetate, called the Hefner lamp.

The mean horizontal candle-power is the average intensity measured in a horizontal plane passing through the source. The mean spherical candle-power is the average candle-power measured in all directions and is equal to the total luminous flux in lumens divided by 4π.

Magnetic field due to a current.—The intensity of the magnetic field in oersted at the center of a circular conductor of radius r in which a current I in absolute electromagnetic units is flowing,

$$H = \frac{2\pi I}{r}$$

If the circular coil has n turns the magnetic intensity at the center is,

$$H = \frac{2\pi n I}{r}$$

The magnetic field in a long solenoid of n turns per centimeter carrying a current I in absolute electromagnetic units

$$H = 4\pi n I$$

If I is given in amperes the above formulae become,—

$$H = \frac{2\pi I}{10r}, \qquad H = \frac{2\pi n I}{10r}, \qquad H = \frac{4\pi n I}{10}$$

Magnetic field due to a magnet.—At a point on the magnetic axis prolonged, at a distance r cm from the center of the magnet of length $2l$ whose poles are $+m$ and $-m$ and magnetic moment M, the field strength in oersted is,

$$H = \frac{4mlr}{(r^2 - l^2)^2}$$

If r is large compared with l,

$$H = \frac{2M}{r^3}$$

At a point on a line bisecting the magnet at right angles, with corresponding symbols,

$$H = \frac{2ml}{(r^2 + l^2)^{\frac{3}{2}}}$$

For large value of r,

$$H = \frac{M}{r^3}$$

Magnetic field intensity or magnetizing force.—Is measured by the force acting on unit pole. Unit field intensity, the oersted, is that field which exerts a force of one dyne on unit magnetic pole. The field intensity is also specified

by the number of lines of force intersecting unit area normal to the field, equal numerically to the field strength in oersted. Magnetizing force is measured by the space rate of variation of magnetic potential and as such its unit may be the **gilbert per centimeter.** The gamma (γ) is equivalent to 0.00001 oersted. Dimensions,—$[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-2}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{-\frac{1}{2}}\ t^{-1}]$.

Magnetic flux through any area perpendicular to a magnetic field is measured as the product of the area by the field strength. The units of magnetic flux, the **maxwell** is the flux through a square centimeter normal to a field of one gauss. The line is also a unit of flux. It is equivalent to the maxwell. Dimensions,—$[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-1}]$.

Magnetic induction resulting when any substance is subjected to a magnetic field is measured as the magnetic flux per unit area taken perpendicular to the direction of the flux. The unit is the maxwell per square centimeter or its equivalent, the gauss. Dimensions,—$[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{-\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{-\frac{1}{2}}\ t^{-1}]$.

If a substance of permeability μ is placed in a magnetic field H the magnetic induction in the substance,

$$\mathbf{M} = \mu H.$$

If I is the magnetic moment for unit volume, or intensity of magnetization,

$$\mathbf{M} = H + 4\pi I.$$

The susceptibility,

$$\kappa = \frac{I}{H}, \qquad \mu = 1 + 4\pi\kappa.$$

Magnetic moment of a magnet is measured by the torque experienced when it is at right angles to a uniform field of unit intensity. The value of the magnetic moment is given by the product of the magnetic pole strength by the distance between the poles. Unit magnetic moment is that possessed by a magnet formed by two poles of opposite sign and of unit strength, one centimeter apart. Dimensions,—$[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-1}]$; $[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}]$.

If the poles are separated by a distance which is great compared with the dimensions of the magnet, the magnetic moment of a magnet of length 1 whose poles have values of $+m$ and $-m$ is,

$$\mathrm{m} = ml.$$

Magnetic permeability is a property of materials modifying the action of magnetic poles placed therein and modifying the magnetic induction resulting when the material is subjected to a magnetic field or magnetizing force. The permeability of a substance may be defined as the ratio of the magnetic induction in the substance to the magnetizing field to which it is subjected. The permeability of a vacuum is unity. Dimensions,—$[\epsilon^{-1}\ l^{-2}\ t^{2}]$; $[\mu]$.

Magnetic pole or quantity of magnetism.—Two unit quantities of magnetism concentrated at points unit distance apart in a vacuum repel each other with unit force. If the distance involved is one centimeter and the force one dyne, the quantity of magnetism at each point is one cgs unit of magnetism. Dimensions,—$[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-1}]$.

Magnetic potential or magnetomotive force at a point is measured by the work required to bring unit positive pole from an infinite distance (zero potential) to the point. The unit is the *gilbert*, that magnetic potential against which an erg of work is done when unit magnetic pole is transferred. Dimensions,—$[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-2}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-1}]$.

Magnifying power of an optical instrument is the ratio of the angle subtended by the image of the object seen through the instrument to the angle subtended by the object when seen by the unaided eye. In the case of the microscope or simple magnifier the object as viewed by the unaided eye is supposed to be a distance of 25 cm (10 in.).

Mass.—Quantity of matter. **Units of mass**—the gram is $\frac{1}{1000}$ the quantity of matter in the International Prototype Kilogram; one of the three fundamental units of the cgs system. The British standard of mass is the pound, of which a standard is preserved by the government. The United States standard mass is the avoirdupois pound defined as 1/2.20462 kilogram.

Mass action, law of.—At a constant temperature the product of the active masses on one side of a chemical equation when divided by the product of the active masses on the other side of the chemical equation is a constant, regardless of the amounts of each substance present at the beginning of the action.

At constant temperature the rate of the reaction is proportional to the concentration of each kind of substance taking part in the reaction.

Mass by weighing on a balance with unequal arms.—If W_1 is the value for one side, W_2 the value for the other, the true mass,

$$W = \sqrt{W_1 W_2}.$$

Mass defect.—Difference between atomic mass and mass number of a nuclide.—See *Packing fraction*

Mass-energy equivalence.—The equivalence of a quantity of mass and a quantity of energy when the two quantities are related by the equation $E = mc^2$. The conversion factor c^2 is the square of the velocity of light. The relationship was developed from **relativity theory,** but has been experimentally confirmed.

Maxwell.—The cgs emu magnetic flux is the flux through a cm^2 normal to a field at 1 cm from a unit magnetic pole.

Maxwell's rule.—A law stating that every part of an electric circuit is acted upon by a force tending to move it in such a direction as to enclose the maximum amount of magnetic flux.

Mechanical equivalent of heat is the quantity of energy which, when transformed into heat, is equivalent to unit quantity of heat; 4.18×10^7 ergs = 1 calorie (20°C).

Meson.—Two types of particles of mass intermediate between that of the electron and proton have been discovered in cosmic radiation and in the laboratory. The one particle with mass about $215m_e$ is called μ-meson, the other with about $280m_e$ π-meson. Mesons of both positive and negative charge have been found and there is now reasonably good evidence for neutral mesons. Both types of mesons decay spontaneously. Some evidence exists for a meson of mass about $1000m_e$.

Metallic elements in general are distinguished from the non-metallic elements by their lustre, malleability, conductivity and usual ability to form positive ions. **Non-metallic** elements are not malleable, have low conductivity and never form positive ions.

Mev.—Mev = million electron volts.

Minimum deviation.—The deviation or change of direction of light passing through a prism is a minimum when the angle of incidence is equal to the angle of emergence. If D is the angle of minimum deviation and A the angle of the prism, the index of refraction of the prism for the wave length used is,

$$n = \frac{\sin \frac{1}{2}(A + D)}{\sin \frac{1}{2}A}$$

Mixtures consist of two or more substances intermingled with no constant percentage composition, and with each component retaining its essential original properties.

Moderator.—A material used for slowing down neutrons in an atomic pile or reactor. Usually graphite or "heavy water" (deuterium oxide).

Modulus of elasticity.—The stress required to produce unit strain, which may be a change of length (Young's modulus); a twist or shear (modulus of rigidity or modulus of torsion) or a change of volume (bulk modulus), expressed in dynes per square centimeter. Dimensions,—the same as of stress, $[m\, l^{-1}\, t^{-2}]$.

Mol volume.—The volume occupied by a mol or a gram molecular weight of any gas measured at standard conditions is 22.414 liters.

A **molal solution** contains one mole per 1000 grams of solvent.

A **molar solution** contains one mole or gram molecular weight of the solute in one liter of solution.

Mole.—Mass numerically equal to the molecular weight. It is most frequently expressed as the gram molecular weight, i. e. as the weight of one mole expressed in grams.

Molecular volume.—Volume occupied by one mole. Numerically equal to the molecular weight divided by the density.

Molecular weight.—The sum of the atomic weights of all the atoms in a molecule.

Molecule.—The smallest unit quantity of matter which can exist by itself and retain all the properties of the original substance.

Moment of force or torque.—The effectiveness of a force to produce rotation about an axis, measured by the product of the force and the perpendicular distance from the line of action of the force to the axis. Cgs unit—the dyne-centimeter. Dimensions,—$[m\, l^2\, t^{-2}]$. If a force F acts to produce rotation about a center at a distance d from the line in which the force acts, the force has a torque,

$$L = Fd.$$

Moment of inertia.—A measure of the effectiveness of mass in rotation. In the rotation of a rigid body not only the body's mass, but the distribution of the mass about the axis of rotation determines the change in the angular velocity resulting from the action of a given torque for a given time. Moment of inertia in rotation is analogous to mass (inertia) in simple translation. The cgs unit is g-cm^2. Dimensions,—$[m\, l^2]$.

If m_1, m_2, m_3, etc. represent the masses of infinitely small particles of a body; r_1, r_2, r_3, etc. their respective distances from an axis of rotation, the moment of inertia about this axis will be

$$I = (m_1r_1^2 + m_2r_2^2 + m_3r_3^2 + \cdots)$$

or

$$I = \Sigma(mr^2)$$

Momentum.—Quantity of motion measured by the product of mass and velocity. Cgs unit—, one gram-centimeter per second. Dimensions,—$[m\, l\, t^{-1}]$.

A mass m moving with velocity v has a momentum,

$$M = mv.$$

If a mass m has its velocity changed from v_1 to v_2 by the action of a force F for a time t,

$$mv_2 - mv_1 = Ft.$$

Monochromatic emissive power is the ratio of the energy of certain defined wave lengths radiated at definite temperatures to the energy of the same wave lengths radiated by a black body at the same temperature and under the same conditions.

Monotropic.—Crystal forms one of which is always metastable with respect to the other.

Mosley's law.—The frequencies of the characteristic X-rays of the elements show a strict linear relationship with the square of the atomic number.

Motion, laws of.—See *Newton's law of motion*

Multiple proportions, law of.—If two elements form more than one compound, the weights of the first element which combine with a fixed weight of the second element are in the ratio of integers to each other.

Negatron.—1. A term used for electron when it is necessary to distinguish between (negative) electrons and positrons. 2. A four element vacuum tube which displays a negative resistance characteristic.

Nernst effect.—When heat flows across the lines of magnetic force, there is observed an electromotive force in the mutually perpendicular direction.

Neutralization is a reaction in which the hydrogen ion of an acid and the hydroxyl ion of a base unite to form water, the other product being a salt.

Neutrino.—An electrically neutral particle of very small (probably zero) rest mass and of spin quantum number $\frac{1}{2}$. When the spin is oriented parallel to the linear momentum the particle is the antineutrino. When the spin is oriented antiparallel to the linear momentum the particle is the neutrino. Postulated by Pauli in explaining the beta decay process.

Whenever a beta (positron) particle is created in a radioactive decay so is an antineutrino (neutrino). The two particles and the parent nucleus share between them the available energy and momentum. Neutrinos and antineutrinos can penetrate amounts of matter measured in light years without appreciable attenuation. Detected by Reines and Cowan using antineutrinos from fission reactors and large scintillation detectors.

Neutron.—A neutral elementary particle of mass number 1. It is believed to be a constituent particle of all nuclei of mass number greater than 1. It is unstable with respect to beta-decay, with a half life of about 12 minutes. It produces no detectable primary ionization in its passage through matter, but interacts with matter predominantly by collisions and, to a lesser extent, magnetically. Some properties of the neutron are: rest mass, 1.00894 atomic mass unit; charge, 0; spin quantum number, $\frac{1}{2}$; magnetic moment, -1.9125 nuclear Bohr *magnetrons*.

Neutron cross section.—See *cross section*

Newton.—The force necessary to give acceleration of one meter per second per second to one kilogram of mass.

Newton's law of cooling.—The rate of cooling of a body under given conditions is proportional to the temperature difference between the body and its surroundings.

Newton's law of motion.

I. Every body continues in its state of rest or of uniform motion in a straight line except in so far as it may be compelled to change that state by the action of some outside force.

II. Change of motion is proportional to force applied and takes place in the direction of the line of action of the force.

III. To every action there is always an equal and opposite reaction.

Nodal points.—Two points on the axis of a lens such that a ray entering the lens in the direction of one, leaves as if from the other and parallel to the original direction.

A **normal salt** is an ionic compound containing neither replaceable hydrogen nor hydroxyl ions.

A **normal solution** contains one gram molecular weight of the dissolved substance divided by the hydrogen equivalent of the substance (that is, one gram equivalent) per liter of solution.

Nuclear atom.—The atom of each element consists of a small dense nucleus which includes most of the mass of the atom. The nucleus is made up of roughly equal numbers of neutrons and protons. The positive charges of the protons enables the nucleus to surround itself with a set of negatively charged electrons which move around the nucleus in complicated orbits with well defined energies. The outermost electrons which are least tightly bound to the nucleus play the dominant part in determining the physical and chemical properties of the atom. There are as many electrons in orbits as there are protons in the nucleus.

Nuclear fusion.—See *fusion*

Nuclear isomers.—Isotopes of elements having the same mass number and atomic number but differing in radioactive properties such as half-life period.

Nucleon.—Any particle found in the structure of an atom's nucleus. The most plentiful ones are neutrons and protons.

Nucleus.—The dense central core of the atom, in which most of the mass and all of the positive charge is concentrated. The charge on the nucleus, an integral multiple of Z of the electronic charge, is the essential factor which distinguishes one element from another. Z is called the atomic number and gives the number of protons in the nucleus, which includes a roughly equal number of neutrons. The mass number A gives the total number of neutrons plus protons.—See *Isotopes and Nuclear Atom*

Nuclide.—A species of atom distinguished by the constitution of its nucleus. The nuclear constitution is specified by the number of protons, Z; number of neutrons, N; and energy content. (Or, by the atomic number, Z; mass number A $(= N + Z)$ and atomic mass.)

Numerical aperture is the sine of half the angular aperture, used as a measure of the optical power of an objective.

Oersted.—The cgs emu of magnetic intensity exists at a point where a force of 1 dyne acts upon a unit magnetic pole at that point, i.e., the intensity 1 cm from a unit magnetic pole.

Ohm's law.—Current in terms of electromotive force E and resistance R.

$$I = \frac{E}{R}.$$

The current is given in amperes when E is in volts and R in ohms.

Organ pipes.—The frequency of vibration of a closed pipe or other air column of length l, where V is the velocity of sound in air, for the fundamental and first three overtones respectively is,

$$n_o = \frac{V}{4l}, \qquad n_1 = \frac{3V}{4l}, \qquad n_2 = \frac{5V}{4l}, \qquad n_3 = \frac{7V}{4l}$$

For an open pipe,

$$n_o = \frac{V}{2l}, \qquad n_1 = \frac{2V}{2l}, \qquad n_2 = \frac{3V}{2l}, \qquad n_3 = \frac{4V}{2l}$$

Oxidation is any process which increases the proportion of oxygen or acid-forming element or radical in a compound.

Packing fraction.—Packing fraction is the difference between the actual mass of the isotope and the nearest whole number divided by the mass number. Thus the packing fraction is equal to $(M - A)/A$ where M is the actual mass and A is the mass number. For example, one of the chlorine isotopes has a mass of 32.9860. The packing fraction for this isotope is

$$\frac{32.9860 - 33.0000}{33.0000} = -0.00042$$

Packing fractions are usually expressed as parts per 10,000 and so the packing fraction for this isotope of chlorine is written as -4.2. Since oxygen is taken as the standard, elements with positive packing fractions are less stable than oxygen, those with negative packing fractions are more stable.

It is positive for nuclides with mass number less than 16 or greater than 180, and negative for most others.

Paramagnetic materials.—Those within which an applied magnetic field is slightly increased by the alignment of electron orbits. The slight diamagnetic effect in materials having magnetic dipole moments is overshadowed by this paramagnetic alignment. As the temperature increases this paramagnetism disappears leaving only diamagnetism. The permeability of paramagnetic materials is slightly greater than that of empty space.

Pascal's law.—Pressure exerted at any point upon a confined liquid is transmitted undiminished in all directions.

Peltier effect.—When a current flows across the junction of two unlike metals it gives rise to an absorption or liberation of heat. If the current flows in the same direction as the current at the hot junction in a thermoelectric circuit of the two metals, heat is absorbed; if it flows in the same direction as the current at the cold junction of the thermoelectric circuit heat is liberated.

Pendulum.—For a simple pendulum of length l, for a small amplitude, the complete period,

$$T = 2\pi\sqrt{\frac{l}{g}} \qquad \text{or} \qquad g = 4\pi^2\frac{l}{T^2}$$

T will be given in seconds if l is in cm and g in cm per sec^2. For a sphere suspended by a wire of negligible mass where d is the distance from the knife edge to the center of the sphere whose radius is r, the length of the equivalent simple pendulum,

$$l = d + \frac{2r^2}{5d}$$

If the period is P for an arc θ, the time of vibration in an infinitely small arc is approximately

$$T = \frac{P}{1 + \frac{1}{4}\sin^2\frac{\theta}{4}}$$

For a compound pendulum, if a body of mass m be suspended from a point about which its moment of inertia is I with its center of gravity a distance h below the point of suspension, the period

$$T = 2\pi\sqrt{\frac{I}{mgh}}$$

Period in uniform circular motion is the time of one complete revolution. In any oscillatory motion it is the time of a complete oscillation. Dimension,—$[t]$.

Periodic law.—Elements when arranged in the order of their atomic weights or atomic numbers show regular variations in most of their physical and chemical properties.

Permeance, the reciprocal of reluctance. Unit permeance is the permeance of a cylinder one square centimeter cross-section and one centimeter length taken in a vacuum. Dimensions—$[\epsilon^{-1}\, l^{-1}\, t^2]$; $[\mu l]$.

Phase of oscillatory motion.—The fraction of a whole period which has elapsed since the moving particle last passed through its middle position in a positive direction.

Photographic density.—The density D of silver deposit on a photographic plate or film is defined by the relation

$$D = \log O$$

where O is the opacity. If I_o and I are the incident and transmitted intensities respectively the opacity is given by I_o/I. The transparency is the reciprocal of the opacity or I/I_o.

Photon.—A photon (or γ-ray) is a quantum of electromagnetic radiation which has zero rest mass and an energy of h

(Planck's constant) times the frequency of the radiation. Photons are generated in collisions between nuclei or electrons and in any other process in which an electrically charged particle changes its momentum. Conversely photons can be absorbed (i.e., annihilated) by any charged particle.

Piezo-electric effect.—The phenomenon exhibited by certain crystals of expansion along one axis and contraction along another when subjected to an electric field. Conversely compression of certain crystals generate an electrostatic voltage across the crystal. Piezoelectricity is only possible in crystal classes which do not possess a center of symmetry.

Pinch effect.—When an electric current, either direct or alternating, passes through a liquid conductor, that conductor tends to contract in cross-section, due to *electromagnetic* forces.

Pitch.—Psychological response of the ear, primarily dependent upon the frequency of vibration of the air. The intensity of the sound also has a certain effect on the pitch. Pitch of a screw is the axial distance between adjacent turns of a single thread on the screw.

Planck's constant (h).—A universal constant of nature which relates the energy of a quantum of radiation to the frequency of the oscillator which emitted it. It has the dimensions of action (energy $\times$ time). Expressed by $E = h\nu$ where E is the energy of the quantum and ν is its frequency. Its numerical value is $(6.62517 \pm 0.00023) \times 10^{-27}$ erg sec.

Plutonium.—A fissile element, artificially produced in the pile by neutron bombardment of U^{238}.

Poise.—A unit of coefficient of viscosity, defined as the tangential force per unit area (dynes/cm^2) required to maintain unit difference in velocity (1 cm/sec) between two parallel planes separated by 1 cm of fluid;

$$1 \text{ poise} = 1 \text{ dyne sec/cm}^2 = 1 \text{ gm/cm sec.}$$

Poisson's ratio is the ratio of the transverse contraction per unit dimension of a bar of uniform cross-section to its elongation per unit length, when subjected to a tensile stress.

Polarized light.—Light which exhibits different properties in different directions at right angles to the line of propagation is said to be polarized. Specific rotation is the power of liquids to rotate the plane of polarization. It is stated in terms of specific rotation or the rotation in degrees per decimeter per unit density.

Polymorphism.—The ability to exist in two or more crystalline forms.

Positron.—A particle of the same mass M_e, as an ordinary electron. It has a positive electrical charge of exactly the same amount as that of an ordinary electron (which is sometimes called negatron). Positrons are created either by the radioactive decay of certain unstable nuclei or, together with a negatron, in a collision between an energetic (more than one Mev) photon and an electrically charged particle (or another photon). A positron does not decay spontaneously but on passing through matter it sooner or later collides with an ordinary electron and in this collision the positron-negatron pair is annihilated. The rest energy of the two particles, which is given by Einstein's relation $E = mc^2$ and amounts to 1.0216 mev altogether, is converted into electromagnetic radiation in the form of one or more photons.

Potential (electric) at any point is measured by the work necessary to bring unit positive charge from an infinite distance. Difference of potential between two points is measured by the work necessary to carry unit positive charge from one to the other. If the work involved is one erg we have the electrostatic unit of potential. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}]$, $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-2}]$.

The potential at a point due to a charge q at a distance r in a medium whose dielectric constant is ϵ is,

$$V = \frac{q}{\epsilon r}$$

Power.—The time rate at which work is done. Units of power,—the watt, one joule (ten million ergs) per second; the kilowatt is equal to 1000 watts; the horse-power, 33,000 foot-pounds per minute, is equal to 746 watts. Dimensions,—$[m\, l^2\, t^{-3}]$.

If an amount of work W is done in time t the power or rate of doing work is

$$P = \frac{W}{t}$$

Power will be obtained in watts if W is expressed in joules (10^7 ergs) and t in sec.

Power in watts for alternating current,

$$P = EI \cos \phi$$

where E and I are the effective values of the electromotive force and current in volts and amperes respectively and ϕ the phase angle between the current and the impressed electromotive force.
The ratio,

$$\frac{P}{EI} = \cos \phi$$

is called the power factor.

Power developed by a direct current.—The power in watts developed by an electric current flowing in a conductor, where E is the difference of potential at its terminals in volts, R its resistance in ohms, and I the current in amperes,

$$P = EI = RI^2$$

The work done in joules in a time t sec is,

$$W = EIt{:}RI^2t.$$

Power ratios in telephone engineering are measured in **decibels.** The gain or loss of power expressed in decibels is ten times the logarithm of the power ratio. By reference to an arbitrarily chosen "power level" the actual power may be expressed in decibels. The numerical values thus used will not be proportional to the actual power level but roughly to the sensation on the ear produced when the electrical power is converted into sound. A difference of 1 decibel in the power supply to a telephone receiver produces approximately the smallest change in volume of sound which a normal ear can detect.

Pressure.—Force applied to, or distributed, over a surface; measured as force per unit area. Cgs unit,—the barye, one dyne per square centimeter. The megabarye is equal to 10^6 dynes per square centimeter. Pressure is also measured by the height of the column of mercury or water which it supports. Dimensions,—$[m\ l^{-1}\ t^{-2}]$.

The pressure due to a force F distributed over an area A,

$$P = \frac{F}{A}$$

Absolute pressure.—Pressure measured with respect to zero pressure. *Gauge pressure*—pressure measured with respect to that of the atmosphere.

Principal focus of a lens or spherical mirror is the point of convergence of light coming from a source at an infinite distance.

Projectiles.—For bodies projected with velocity v at an angle a above the horizontal, the time to highest point of flight.

$$t = \frac{v \sin a}{g}$$

Total time of flight to reach the original horizontal plane,

$$T = \frac{2v \sin a}{g}$$

Maximum height,

$$h = \frac{v^2 \sin^2 a}{2g}$$

Horizontal range,

$$R = \frac{v^2 \sin 2a}{g}$$

In the above equations the resistance of the air is neglected g is the acceleration due to gravity.

Proton.—An elementary particle having a positive charge equivalent to the negative charge of the electron but possessing a mass approximately 1837 times as great. The proton is in effect the positive nucleus of the hydrogen atom.

Purkinje effect.—A phenomenon associated with the human eye, making it more sensitive to blue light when the illumination is poor (less than about 0.1 lumen per sq. ft.) and to yellow light when the illumination is good.

Quality or timbre of a sound depends on the coexistence with the fundamental of other vibrations of various frequencies and amplitudes.

Quantity of electricity or charge.—The electrostatic unit of charge, the quantity which when concentrated at a point and placed at unit distance from an equal and similarly concentrated quantity, is repelled with unit force. If the distance is one centimeter and force of repulsion one dyne and the surrounding medium a vacuum, we have the electrostatic unity of quantity. The electrostatic unit of quantity may be defined as that transferred by electrostatic unit current in unit time. The quantity transferred by one ampere in one second is the coulomb, the practical unit. The faraday is the electrical charge carried by one gram equivalent. The coulomb $= 3 \times 10^9$ electrostatic units. Dimensions,—

$$[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-1}];\ [\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}].$$

Quantum.—Unit quantity of energy postulated in the quantum theory. The *photon* is a quantum of the electromagnetic field, and in nuclear field theories, the *meson* is considered to be the quantum of the nuclear field.

Radiation.—The emission and propagation of energy through space or through a material medium in the form of waves.

The term may be extended to include streams of sub-atomic particles as alpha-rays, or beta-rays, and cosmic rays as well as electromagnetic radiation. Often used to designate the energy alone without reference to its character. In the case of light this energy is transmitted in bundles (photons).

Radiation formula, Planck's.—The emissive power of a black body at wave length λ may be written

$$E_\lambda = \frac{c_1 \lambda^{-5}}{e^{c_2/\lambda T} - 1}$$

where c_1 and c_2 are constants with c_1 being 3.7403×10^{10} microwatts microns^4 per cm^2 or 3.7403×10^{-12} watt cm^2, c_2 being 14384 micron degrees and T the absolute temperature.

Radioactive nuclides.—Atoms that disintegrate by emission of corpuscular or electromagnetic radiations. The rays most commonly emitted are alpha or beta or gamma rays. The three classes are:

1. Primary, which have half-life times exceeding 10^8 years. These may be alpha-emitters or beta-emitters.
2. Secondary, which are formed in radioactive transformations starting with U^{238}, U^{235}, or Th^{232}.
3. Induced, having geologically short lifetimes and formed by induced nuclear reactions occurring in nature. All these reactions result in transmutation.

Radius of gyration may be defined as the distance from the axis of rotation at which the total mass of a body might be concentrated without changing its moment of inertia. The product of total mass and the square of the radius of gyration will give (the) moment of inertia.

Rankine scale of temperature.—The absolute Fahrenheit scale.

°F + 459.69 = °R; thus 0°F Rankine = −459.69°F.

Raoult's law.—Molar weights of non-volatile non-electrolytes when dissolved in a definite weight of a given solvent under the same conditions lower the solvent's freezing point, elevate its boiling point and reduce its vapor pressure equally for all such solutes.

Reduction is any process which increases the proportion of hydrogen or base-forming elements or radicals in a compound. Reduction is also the gaining of electrons by an atom, an ion, or an element thereby reducing the positive valence of that which gained the electron.

Reflection coefficient or reflectivity is the ratio of the light reflected from a surface to the total incident light. The coefficient may refer to diffuse or to specular reflection. In general it varies with the angle of incidence and with the wavelength of the light.

Reflection of light by a transparent medium in air (Fresnel's formulae).—If i is the angle of incidence, r the angle of refraction, n_1 the index of refraction for air (nearly equal to unity), n_2 index of refraction for a medium, then the ratio of the reflected light to the incident light is,

$$R = \tfrac{1}{2}\left(\frac{\sin^2(i-r)}{\sin^2(i+r)} + \frac{\tan^2(i-r)}{\tan^2(i+r)}\right)$$

If $i = 0$ (normal incidence), and $n_1 = 1$ (approximate for air),

$$R = \left(\frac{n_2 - 1}{n_2 + 1}\right)^2$$

Refraction.—See *Index of refraction; Snell's law.*

Refraction at a spherical surface.—If u be the distance of a point source, v the distance of the point image or the intersection of the refracted ray with the axis, n_1 and n_2 the indices of refraction of the first and second medium, and r the radius of curvature of the separating surface,

$$\frac{n_2}{v} + \frac{n_1}{u} = \frac{n_2 - n_1}{r}$$

If the first medium is air the equation becomes,

$$\frac{n}{v} + \frac{1}{u} = \frac{n-1}{r}$$

Refractivity is given by $(n - 1)$ when n is the index of refraction; the **specific refractivity** is given by $\frac{n-1}{d}$ where d is the density. **Molecular refractivity** is the product of specific refractivity by the molecular weight.

Relative humidity.—The ratio of the quantity of water vapor present in the atmosphere to the quantity which would saturate at the existing temperature. It is also the ratio of the pressure of water vapor present to the pressure of saturated water vapor at the same temperature.

Reluctance is that property of a magnetic circuit which determines the total magnetic flux in the circuit when a given magnetomotive force is applied. Unit, the reluctance of one centimeter length and one square centimeter cross-section of space taken in a vacuum. Dimensions,—$[\epsilon l\, t^{-2}]$; $[\mu^{-1}\, l^{-1}]$.

Reluctivity or specific reluctance is the reciprocal of magnetic permeability. The reluctivity of empty space is taken as unity. Dimensions,—$[\epsilon l^2\, t^{-2}]$; $[\mu^{-1}]$.

Resistance is a property of conductors depending on their dimensions, material and temperature which determines the current produced by a given difference of potential. The practical unit of resistance, the **ohm** is that resistance through which a difference of potential of one volt will produce a current of one ampere. The **international ohm** is the resistance offered to an unvarying current by a column of mercury at 0°C, 14.4521 grams in mass, of constant cross-sectional area and 106.300 centimeters in length, sometimes called the legal ohm. Dimensions,—$[\epsilon^{-1}\, l^{-1}\, t]$; $[\mu l\, t^{-1}]$.

Resistance of a conductor at 0°C, of length l, cross-section s and specific resistance ρ

$$R_o = \rho\frac{l}{s}$$

The resistivity may be expressed as ohm-cm when R is in ohms, l in cm and s in cm².

Resistance of a conductor at a temperature t whose resistance at 0°C is R_o and whose temperature resistance coefficient is α

$$R_t = R_o(1 + \alpha t)$$

Resistance of conductors in series and parallel.—The total resistance of any number of resistances joined in series is the sum of the separate resistances. The total resistance of conductors in parallel whose separate resistances are r_1, r_2, $r_3 \ldots r_n$ is given by the formula

$$\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3} \cdots + \frac{1}{r_n}$$

Where R is the total resistance. For two terms this becomes,

$$R = \frac{r_1 r_2}{r_1 + r_2}$$

Resistance, specific (Resistivity).—A proportionality factor characteristic of different substances equal to the **resistance** that a centimeter cube of the substance offers to the passage of electricity, the current being perpendicular to two parallel faces. It is defined by the expression:

$$R = \rho \frac{l}{A}$$

where R is the resistance of a uniform conductor, l is its length, A is its cross sectional area, and ρ is its resistivity. Resistivity is usually expressed in ohm-centimeters.

Resolving power of a telescope or microscope is indicated by the minimum separation of two objects for which they appear distinct and separate when viewed through the instrument.

Resonance (chemical).—The moving of electrons from one atom of a molecule or ion to another atom of that molecule or ion. It is simply the oriented movement of the bonds between atoms.

Restitution, coefficient of, for two bodies on impact.—The ratio of the difference in velocity, after impact to the difference before impact.

Reversible reaction.—One which can be caused to proceed in either direction by suitable variation in the conditions of temperature, volume, pressure or of the quantities of reacting substances.

Roentgen.—A radiation unit, that amount of radiation that will produce one electrostatic unit of ions per cubic centimeter volume.

Rotatory power is the power of rotating the plane of polarized light, given in general by θ/l where θ is the total rotation which occurs in a distance l.

The **molecular** or **atomic rotatory power** is the product of the specific rotatory power by the molecular or atomic weight. Magnetic rotatory power is given by

$$\theta/e\ H \cos \alpha$$

where H the intensity of the magnetic field, and α the angle between the field and the direction of the light.

Rydberg formula.—A formula, similar to that of Balmer, for expressing the wave-numbers (ν) of the lines in a spectral series:

$$\nu = R\left[\frac{1}{(n+a)^2} - \frac{1}{(m+b)^2}\right]$$

where n and m are integers and $m > n$, a and b are constants for a particular series, and R is the *Rydberg constant,* 109677.8 cm^{-1} for hydrogen.

Salt.—Any substance which yields ions, other than hydrogen or hydroxyl ions. A salt is obtained by displacing the hydrogen of an acid by a metal.

Scintillometer.—An instrument which detects radiation by emitting flashes of light.

Seebeck effect.—If a circuit consists of two metals, one junction hotter than the other, a current flows in the circuit. The direction of the flow depends on the metals and the temperature of the junctions.

Sensitiveness of a balance.—Assuming the three knife edges of a balance to lie on a straight line,—if M is the weight of the beam, h the distance of the center of gravity below the knife edge, L the length of the balance arms and m a small mass added to one pan, the deflection θ produced is given by

$$\tan \theta = \frac{mL}{Mh}.$$

Shell.—According to *Pauli's exclusion principle* (q.v.), the extranuclear electrons do not circle around the nucleus all in orbits of the same radius, but are arranged in orbits at various distances from the nucleus. The extranuclear orbital electrons are thus assumed to be arranged in a series of concentric spheres, called *shells,* which are designated, in the order of increasing distance from the nucleus, as K, L, M, N, O, P, and Q shells. The number of the electrons which each of these shells can contain is limited. All electrons arranged in the same shell have the same principal quantum number. The electrons in the same shell are grouped into various subshells (q.v.), and all the electrons in the same subshell have the same orbital angular momentum.—See *Subshell*

Simple harmonic motion.—Periodic oscillatory motion in a straight line in which the restoring force is proportional to the displacement. If a point moves uniformly in a circle, the motion of its projection on the diameter (or any straight line in the same plane) is simple harmonic motion.

If r is the radius of the reference circle, ω the angular velocity of the point in the circle, θ the angular displacement at the time t after the particle passes the mid-point of its path, the linear displacement,

$$x = r \sin \theta = r \sin \omega t.$$

The velocity at the same instant,

$$v = r\omega \cos \theta = \omega \sqrt{r^2 - x^2}$$

The acceleration,

$$a = -\omega^2 x.$$

The force for a mass m,

$$F = m\omega^2 x = -\frac{4\pi^2 m x}{T^2}$$

The period,

$$T = 2\pi \sqrt{\frac{x}{a}}$$

DEFINITIONS AND FORMULAS (Continued)

In the above equations the cgs system calls for x and r in cm, v in cm per sec, a in cm per sec^2, T in sec, m in grams, F in dynes, θ in radians and ω in radians per sec.

Simple machine.—A contrivance for the transfer of energy and for increased convenience in the performance of work.

Mechanical advantage is the ratio of the resistance overcome to the force applied. Velocity ratio is the ratio of the distance through which force is applied to the distance through which resistance is overcome.

Efficiency is the ratio of the work done by a machine to the work done upon it.

If a force f applied to a machine through a distance S results in a force F exerted by the machine through a distance s, neglecting friction,

$$fS = Fs.$$

The theoretical mechanical advantage or velocity ratio in the above case is, $\frac{S}{s}$.

Actually the force obtained from the machine will have a smaller value than will satisfy the equation above. If F' be the actual force obtained, the practical mechanical advantage will be, $\frac{F'}{f}$.

The efficiency of the machine,

$$E = \frac{F's}{fS}.$$

Snell's law of refraction.—If i is the angle of incidence, r the angle of refraction, v the velocity of light in the first medium, v' the velocity in the second medium, the index of refraction n,

$$n = \frac{\sin i}{\sin r} = \frac{v}{v'}$$

Solid.—A state of matter in which the relative motion of the molecules is restricted and they tend to retain a definite fixed position relative to each other, giving rise to crystal structure. A solid may be said to have a definite shape and volume.

Solid angle.—Measured by the ratio of the surface of the portion of a sphere enclosed by the conical surface forming the angle, to the square of the radius of the sphere. Unit of solid angle,—the steradian, the solid angle which encloses a surface on the sphere equivalent to the square of the radius. Dimensions,—unity.

Solubility of one liquid or solid in another is the mass of a substance contained in a solution which is in equilibrium with an excess of the substance. Under these conditions the solution is said to be saturated. Solubility of a gas is the ratio of concentration of gas in the solution to the concentration of gas above the solution.

Solubility product or precipitation value is the product of the concentrations of the ions of a substance in a saturated solution of the substance. These concentrations are frequently expressed as moles of solute per liter of solution.

Solute.—That constituent of a solution which is considered to be dissolved in the other, the solvent. The solvent is usually present in larger amount than the solute.

A **solution** is **saturated** if it contains at given temperature as much of a solute as it can retain in the presence of an excess of that solute.

A **true solution** is a mixture, liquid, solid or gaseous, in which the components are uniformly distributed throughout the mixture. The proportion of the constituents may be varied within certain limits.

Solvent.—That constituent of a solution which is present in larger amount; or, the constituent which is liquid in the pure state, in the case of solutions of solids or gases in liquids.

Specific gravity.—The ratio of the mass of a body to the mass of an equal volume of water at 4°C or other specified temperature. Dimensions,—unity.

Specific heat of a substance is the ratio of its thermal capacity to that of water at 15°C. Dimensions,—unity.

If a quantity of heat H calories is necessary to raise the temperature of m grams of a substance from t_1 to t_2°C, the specific heat, or more properly, thermal capacity of the substance,

$$s = \frac{H}{m(t_2 - t_1)}.$$

Specific heat by the method of mixtures.—Where a mass m_1 of the substance is heated to a temperature t_1, then placed in a mass of water m_2 at a temperature t_2 contained in a calorimeter with stirrer (of same material) of mass m_3, specific heat of the calorimeter c, t_3 the final temperature

$$m_1 s(t_1 - t_3) = m_3 c + m_2(t_3 - t_2).$$

Black's ice calorimeter.—If a body of mass m and temperature t melts a mass m' of ice, its temperature being reduced to 0°C, the specific heat of the substance is,

$$s = \frac{80\ 1m'}{mt}$$

Bunsen's ice calorimeter.—A body of mass m at temperature t causes a motion of the mercury column of l centimeters in a tube whose volume per unit length is v. The specific heat is

$$s = \frac{884lv}{mt}$$

Specific inductive capacity.—The ratio of the capacitance of a condenser with a given substance as dielectric to the

capacitance of the same condenser with air or a vacuum as dielectric is called the specific inductive capacity. The ratio of the dielectric constant of a substance to that of a vacuum.

Specific rotation.—If there are n grams of active substance in v cubic centimeters of solution and the light passes through l centimeters, r being the observed rotation in degrees, the specific rotation (for 1 centimeter),

$$[\alpha] = \frac{rv}{nl}$$

Specific volume is the reciprocal of density. Dimensions,—$[m^{-1} l^3]$.

Spectral series are spectral lines or groups of lines which occur in an orderly sequence.

Speed.—Time rate of motion measured by the distance moved over in unit time. Cgs unit,—one centimeter per second. Dimension,—$[l\ t^{-1}]$.

Spherical aberration.—When large surfaces of spherical mirrors or lenses are used the light divergent from a point source is not exactly focused at a point. The phenomenon is known as spherical aberration. For axial pencils the error is known as axial spherical aberration; for oblique pencils, coma.

Spherical mirrors.—If R is the radius of curvature, F principal focus, and f_1 and f_2 any two conjugate focal distances,

$$\frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{F} = \frac{2}{R}$$

If the linear dimensions of the object and image be O and I respectively and u and v their distances from the mirror,

$$\frac{O}{I} = \frac{u}{v}$$

Spin.—In nuclear physics, used to describe the angular momentum of elementary particles or of nuclei.

Standard conditions for gases.—Measured volumes of gases are quite generally recalculated to 0 degrees C temperature and 760 mm pressure, which have been arbitrarily chosen as standard conditions.

Stark effect.—The splitting of a single spectrum line into multiple lines which occurs when the emitting material is placed in a strong electric field. The observed effect depends on the angle between the direction of the field and the direction of observation. The effect is due to the shifting of the energy states of certain orbits which all have the same energy in zero field.

Statcoulomb.—The unit of electric charge in the metric system. 3×10^9 statcoulombs = 1 coulomb.

Stationary or standing waves are produced in a medium by the simultaneous transmission, in opposite directions of two similar wave motions. Fixed points of minimum amplitude are called **nodes.** A **segment** extends from one node to the next. An **antinode** or **loop** is the point of maximum amplitude between two nodes.

Stefan-Boltzmann law of radiation.—The energy radiated in unit time by a black body is given by, $E = K(T^4 - T_o^4)$, where T is the absolute temperature of the body, T_o the absolute temperature of the surroundings, and K a constant.

Stoichiometric.—Pertaining to weight relations in chemical reactions.

Stoke.—See under viscosity.

Stokes' law.—1. Gives the rate of fall of a small sphere in a viscous fluid. When a small sphere falls under the action of gravity through a viscous medium it ultimately acquires a constant velocity,

$$V = \frac{2ga^2(d_1 - d_2)}{9\eta}$$

where a is the radius of the sphere, d_1 and d_2 the densities of the sphere and the medium respectively, and η the coefficient of viscosity. V will be in cm per sec if g is in cm per sec^2, a in cm, d_1 and d_2 in g per cm^3 and η in dyne-sec per cm^2 or poises.

2. The empirical law stating that the wavelength of light emitted by a fluorescent material is longer than that of the radiation used to excite the fluorescence. In modern language the emitted photons carry off less energy than is brought in by the exciting photons; the details accord with the energy conservation principle.

Strain.—The deformation resulting from a stress measured by the ratio of the change to the total value of the dimension in which the change occurred. Dimensions,—unity.

Stress.—The force producing or tending to produce deformation in a body measured by the force applied per unit area Cgs units,—one dyne per square centimeter. Dimensions,—$[m\ l^{-1}\ t^{-2}]$.

Subshell.—The electrons within the same shell (energy level) of the atom are characterized by the same principal quantum number (n), and are further divided into groups according to the value of their azimuthal quantum numbers (l); the electrons which possess the same azimuthal quantum number for the same principal quantum number are considered to occupy the same subshell (or sublevel). The individual subshells are designated with the letters s, p, d, f, g, and h, as follows:

l value	designation of subshell
0	s
1	p
2	d
3	f
4	g
5	h

An electron assigned to the *s*-subshell is called an *s*-electron, one assigned to the *p*-subshell is referred to as a *p*-electron, etc. In formulae of electron structure, the value of the principal quantum number (n) is prefixed to the letter indicating the azimuthal quantum number (l) of the electron; thus, e.g., a 4*f*-electron is an electron which has the principal quantum number 4 (i.e. assigned to the *N*-shell) and the orbital angular momentum 3 (*f*-subshell).

Surface density of electricity.—Quantity of electricity per unit area. Dimensions,—$[\epsilon^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$; $[\mu^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$.

Surface density of magnetism.—Quantity of magnetism per unit area. Dimensions,—$[\epsilon^{-1}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$, $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$.

Surface tension.—Two fluids in contact exhibit phenomena, due to molecular attractions which appear to arise from a tension in the surface of separation. It may be expressed as dynes per cm or as ergs per square centimeter. Dimensions, —$[m\, t^{-2}]$.

The total force along a line of length l on the surface of a liquid whose surface tension is T,

$$F = lT.$$

Capillary tubes.—If a liquid of density d rises a height h in a tube of internal radius r the surface tension is,

$$T = \frac{rhdg}{2}$$

The tension will be in dynes per cm if r and h are in cm, d in g per cm^3 and g in cm per sec^2.

Drops and bubbles.—Pressure in dynes per cm^2 due to surface tension on a drop of radius r cm for a liquid whose surface tension is T dynes per cm,

$$P = \frac{2T}{r}$$

For a bubble of mean radius r cm,

$$P = \frac{4T}{r}.$$

Susceptibility (magnetic) is measured by the ratio of the intensity of magnetization produced in a substance to the magnetizing force or intensity of field to which it is subjected. The susceptibility of a substance will be unity when unit intensity of magnetization is produced by a field of one gauss. Dimensions,—$[\epsilon^{-1}\, l^{-2}\, t^2]$, $[\mu]$.

Tangent galvanometer.—A tangent galvanometer with n turns, of radius r, in the earth's field H, has a deflection θ. The current flowing is,

$$i = \frac{Hr}{2\pi n} \tan \theta$$

If $\frac{2\pi n}{r} = G$ (the galvanometer constant).

$$i = \frac{H}{G} \tan \theta$$

Temperature may be defined as the condition of a body which determines the transfer of heat to or from other bodies. Particularly it is a manifestation of the average translational kinetic energy of the molecules of a substance due to heat agitation. The customary unit of temperature is the **Centigrade** degree, $\frac{1}{100}$ the difference between the temperature of melting ice and that of water boiling under standard atmospheric pressure. **Celsius scale.**—The Celsius temperature scale is a designation of the scale also known as the centigrade scale. The degree **Fahrenheit** is $\frac{1}{180}$, and the degree **Reaumur** $\frac{1}{80}$ the same difference of temperature.

The fundamental temperature scale is the absolute, thermodynamic or **Kelvin scale** in which the temperature measure is based on the average kinetic energy per molecule of a perfect gas. The zero of the Kelvin scale is -273.15°C. The temperature scale adopted by the International Bureau of Weights and Measures is that of the constant volume hydrogen gas thermometer. The magnitude of the degree in both these scales is defined as $\frac{1}{100}$ the difference between the temperature of melting ice and that of boiling water at 760 mm pressure. Frequently the Kelvin scale is defined as degrees C + 273.15 and the Rankine scale as degrees F + 459.67°F.

The fundamental temperature scale is now defined by means of the equation

$$\theta(\mathrm{X}) = 273.15^\circ\mathrm{K}\, \frac{\mathrm{X}}{\mathrm{X}_3}$$

where θ denotes the temperature; X the thermometric property (P, V, . . .); the subscript 3 refers to the triple point of water; and 273.16°K is the arbitrary fixed point for the temperature associated with the triple point of water.

The ideal gas temperature θ, (numerically equal to the Kelvin temperature), in particular, is defined by either of the two equations:

$$\theta = \begin{cases} 273.15^\circ \lim\limits_{\mathrm{P_3}\to 0} \dfrac{\mathrm{P}}{\mathrm{P_3}}, \text{ const. V} \\ 273.15^\circ \lim\limits_{\mathrm{P}\to 0} \dfrac{\mathrm{V}}{\mathrm{V_3}}, \text{ const. P} \end{cases}$$

Temperature resistance coefficient.—The ratio of the change of resistance in a wire due to a change of temperature of 1°C to its resistance at 0°C. Dimension,—$[\theta^{-1}]$.

Thermal capacity of a substance is the quantity of heat necessary to produce unit change of temperature in unit mass.

It is ordinarily expressed as calories per gram per degree Centigrade. Numerically equivalent to specific heat.

Thermal capacity or water equivalent.—The total quantity of heat necessary to raise any body or system unit temperature, measured as calories per degree centigrade in the cgs system. Dimension,—$[m]$.

Thermal expansion.—The coefficient of linear expansion or expansivity is the ratio of the change in length per degree C to the length at 0°C. The coefficient of volume expansion (for solids) is approximately three times the linear coefficient. The coefficient of volume expansion for liquids is the ratio of the change in volume per degree to the volume at 0°C. The value of the coefficient varies with temperature. The coefficient of volume expansion for a gas under constant pressure is nearly the same for all gases and temperatures and is equal to 0.00367 for 1°C. Dimension,—$[\theta^{-1}]$.

If l_o is the length at 0°C, α the coefficient of linear expansion, the length at t°C is,

$$l_t = l_o(1 + \alpha t).$$

General formula for thermal expansion.—The rate of thermal expansion varies with the temperature. The general equation giving the magnitude m_t (length or volume) at a temperature t, where m_o is the magnitude at 0°C, is

$$m_t = m_o(1 + \alpha t + \beta t^2 + \gamma t^3 \cdots)$$

where α, β, γ, etc. are empirically determined coefficients.

Volume expansion.—If V represents volume and β the coefficient of expansion,

$$V_t = V_o(1 + \beta t).$$

For solids,

$$\beta = 3\alpha \text{ (approximately)}.$$

Thermal neutrons.—Neutrons slowed down by a moderator to an energy of a fraction of an electron volt—about 0.025 ev. at 15°.

Thermionic emission.—Electron or ion emission due to the temperature of the emitter. The rate of emission increases rapidly with the increase of temperature. It is also very sensitive to the state of the surface.

Thermodynamics, law of.

I. When mechanical work is transformed into heat or heat into work, the amount of work is always equivalent to the quantity of heat.

II. It is impossible by any continuous self-sustaining process for heat to be transferred from a colder to a hotter body.

Thermoelectric power is measured by the electromotive force produced by a thermocouple for unit difference of temperature between the two junctions. It varies with the average temperature and is usually expressed in microvolts per degree C. It is customary to list the thermoelectric power of the various metals with respect to lead. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} t^{-1} \theta^{-1}]$.

Thomson thermoelectric effect is the designation of the potential gradient along a conductor which accompanies a temperature gradient. The magnitude and direction of the potential varies with the substance.

The coefficient of the Thomson effect or specific heat of electricity is expressed in joules per coulomb per degree Centigrade. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}]$, $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2} \theta^{-1}]$.

Time, unit of.—The fundamental invariable unit of time is the ephemeris second, which is defined as 1/31,556,925.9747 of the tropical year for 1900 January 0^d12^h ephemeris time. The ephemeris day is 86,400 ephemeris seconds.

The former unit of time was the mean solar second, defined as 1/86,400 of the mean solar day. (See supplementary list).

Torque produced by the action of one magnet on another.—The turning moment experienced by a magnet of pole strength m' and length $2l'$ placed at a distance r from another magnet of length $2l$ and pole strength m, where the center of the first magnet is on the axis (extended) of the second and the axis of the first is perpendicular to the axis of the second,

$$C = 8\frac{mm'll'}{r^3} = \frac{2MM'}{r^3}$$

If the first magnet is deflected through an angle θ, the expression becomes,

$$C = \frac{2MM'}{r^3}\cos\theta$$

Torsional vibration.—See *Angular harmonic motion*

Total reflection.—When light passes from any medium to one in which the velocity is greater, refraction ceases and total reflection begins at a certain critical angle of incidence θ such that

$$\sin\theta = \frac{1}{n}$$

where n is the index of the first medium with respect to the second. If the second medium is air n has the ordinary value for the first medium. For any other second medium,

$$n = \frac{n_1}{n_2}$$

where n_1 and n_2 are the ordinary indices of refraction for the first and second medium respectively.

Tractive force of a magnet.—If a magnet with induction B has a pole face of area A the force, is,

$$F = \frac{B^2A}{8\pi}$$

If B and A are in cgs units, F will be in dynes.

Transmutation.—A nuclear change producing a new element from an old one.

Transuranic elements.—Elements of atomic numbers above 92. All of them are radioactive and are products of artificial nuclear changes. All are members of the actinide group.

Triangle or polygon of forces.—If three or more forces acting on the same point are in equilibrium, the vectors representing them form, when added, a closed figure.

Tritium.—An isotope of hydrogen with a mass of three, structure, two neutrons, and one proton in its nucleus.

Uncertainty principle.—See *Indeterminancy*

Uniform circular motion.—If r is the radius of a circle, v the linear speed in the arc, ω the angular velocity and T the period or time of one revolution,

$$\omega = \frac{v}{r} = \frac{2\pi}{T}$$

The acceleration toward the center is

$$a = \frac{v^2}{r} = \omega^2 r = \frac{4\pi^2 r}{T^2}$$

The centrifugal force for a mass m,

$$F = \frac{mv^2}{r} = m\omega^2 r = \frac{4\pi^2 mr}{T^2}$$

In the above equations ω will be in radians per second and a in cm per sec^2 if r is in cm, v in cm per sec and T in sec. F will be in dynes if mass is in grams and other units as above.

Application to the solar system.—If M is the mass of the sun, G the constant of gravitation, P the period of the planet and r the distance of the planet from the sun, then the mass of the sun

$$M = \frac{4\pi^2 r^3}{GP^2}, \quad (G = 6.670 \times 10^{-8} \text{ for cgs units}).$$

If P is the period and r the distance of a satellite revolving around the planet, the above expression for M gives the mass of the planet. The formula is written on the assumption that the orbit of the planet or satellite is circular, which is only approximately true.

Uniformly accelerated rectilinear motion.—If v_o is the initial velocity, v_t the velocity after time t, the acceleration,

$$a = \frac{v_t - v_o}{t}$$

The velocity after time t,

$$v_t = v_o + at$$

Space passed over in time t,

$$s = v_o t + \tfrac{1}{2}at^2$$

Velocity after passing over space s,

$$v = \sqrt{v_o^2 + 2as}$$

Space passed over in the nth second

$$s = v_o + \tfrac{1}{2}a(2n - 1).$$

In the above and following similar equations the values of the space, velocity, and acceleration must be substituted in the same system. For space in *cm*, velocity will be in *cm* per sec and acceleration in *cm* per sec per sec.

Unit.—Specific magnitude of a quantity, set apart by appropriate definition, which is to serve as a basis of comparison or measurement for other quantities of the same nature.

Valence of an atom of an element is that property which is measured by the number of atoms of hydrogen (or its equivalent) one atom of that element can hold in combination if negative, or can displace in a reaction if it is positive.

Valence electrons of the atom are electrons which are gained, lost or shared in chemical reactions.

Van der Waals' equation of state.—This equation is expressed by:

$$\left(p + \frac{a}{v^2}\right)(v - b) = RT$$

It makes allowance both for the volume occupied by the molecules and for the attractive force between the molecules. b is the effective volume of molecules in one mole of gas. a is a measure of the attractive force between the molecules. For values of R, a, and b see index for table of Van der Waal's constants for gasses.

Van't Hoff's principle.—If the temperature of interacting substances in equilibrium is raised, the equilibrium concentrations of the reaction are changed so that the products of that reaction which absorb heat are increased in quantity, or if the temperature for such an equilibrium is lowered, the products which evolve heat in their formation are increased in amounts.

Vapor.—The words **vapor** and **gas** are often used interchangeably. **Vapor** is more frequently used for a substance which, though present in the gaseous phase, generally exists as a liquid or solid at room temperature. **Gas** is more frequently used for a substance that generally exists in the gaseous phase at room temperature. Thus one would speak of iodine or carbon tetrachloride vapors and of oxygen gas.

Vapor pressure.—The pressure exerted when a solid or liquid is in equilibrium with its own vapor. The vapor pressure is a function of the substance and of the temperature.

Vectors, composition of.—If the angle between two vectors is A, and their magnitude a and b, their resultant,

$$C = \sqrt{a^2 + b^2 - 2ab \cos A}.$$

Velocity.—Time rate of motion in a fixed direction. Cgs units,—one centimeter per second. Dimensions,—$[l\ t^{-1}]$.

If s is space passed over in time t, the velocity,

$$v = \frac{s}{t}$$

Velocity of a compressional wave.—The velocity of a compressional wave in an elastic medium, in terms of elasticity E (bulk modulus) and density d,

$$V = \sqrt{\frac{E}{d}}$$

For the velocity of sound in air, where p is the pressure and d the density,

$$V = \sqrt{\frac{1.4p}{d}}$$

Velocity of efflux of a liquid.—If h is the distance from the opening to the free surface of the liquid, the velocity of efflux is

$$V = \sqrt{2gh}$$

The above is the theoretical discharge velocity disregarding friction and the shape of orifice. For water issuing through a circular opening with sharp edges of area, A, the volume discharged per second is given approximately by,

$$Q = 0.62A\sqrt{2gh}$$

Velocity of sound, variation with temperature.—The velocity in meters per sec at any temperature t in °C is given approximately by

$$V = V_o\sqrt{1 + \frac{t}{273}}$$

$$V = 331.5 + .607t$$

The **variation with humidity** is given by the equation

$$V_d = V_h\sqrt{1 - \frac{e}{p}\left(\frac{\gamma_\omega}{\gamma_a} - \frac{5}{8}\right)}$$

where V_d is the velocity in dry air, V_h that in air at barometric pressure p in which the pressure of water vapor is e. γ_ω and γ_a are the specific heat ratios for water vapor and for air respectively.

Velocity of a transverse wave in a stretched cord. If T is the tension of the cord and m the mass per unit length,

$$V = \sqrt{\frac{T}{m}}$$

Velocity of water waves.—If the depth h is small compared with the wave length, the velocity,

$$V = \sqrt{gh}$$

In deep water for a wave length λ,

$$V = \sqrt{\frac{g\lambda}{2\pi}}$$

If the wavelength is very small, less than about 1.6 cm, the velocity increases as the wave length decreases and is expressed by the following,

$$V = \sqrt{\frac{2\pi T}{\lambda d} + \frac{g\lambda}{2\pi}}$$

where T is the surface tension and d the density of the liquid V will be given in cm per sec if h and λ are in cm, g in cm per sec^2, T in dynes per cm and d in g per cm^3.

Velocity of a wave.—The velocity of propagation in terms of wavelength λ and the period T or frequency n is,

$$V = \frac{\lambda}{T} = n\lambda$$

Viscosity.—All fluids possess a definite resistance to change of form and many solids show a gradual yielding to forces tending to change their form. This property, a sort of internal friction, is called viscosity; it is expressed in dyne-seconds per cm^2 or poises. Dimensions,—$[m\ l^{-1}\ t^{-1}]$. If the tangential force per unit area, exerted by a layer of fluid upon one adjacent is one dyne for a space rate of variation of the tangential velocity of unity, the viscosity is one poise.

Kinematic viscosity is the ratio of viscosity to density. The c. g. s. unit of kinematic viscosity is the **stoke.**

Flow of liquids through a tube; where l is the length of the tube, r its radius, p the difference of pressure at the ends, η the coefficient of viscosity, the volume escaping per second,

$$v = \frac{\pi p r^4}{8l\eta}\ \text{(Poiseuille)}.$$

The volume will be given in cm^3 per second if l and r are in cm, p in dynes per cm^2 and η in poises or dyne-seconds per cm^2.

Visibility is measured by the ratio of the luminous flux in lumens to the total radiant energy in ergs per second or in watts.

Volt.—The unit of electromotive force. It is the difference in potential required to make a current of one ampere flow through a resistance of one ohm.

Volume, unit of.—The cubic centimeter, the volume of a cube whose edges are one centimeter in length. Other units of volume are derived in a similar manner. Dimension,—$[l^3]$.

Wave motion.—A progressive disturbance propagated in a medium by the periodic vibration of the particles of the medium. Transverse wave motion is that in which the vibration of the particles is perpendicular to the direction of propagation. Longitudinal wave motion is that in which the vibration of the particles is parallel to the direction of propagation.

Weight.—The force with which a body is attracted toward the earth. Cgs unit,—the dyne. Dimensions,—$[m\, l\, t^{-2}]$.

Although the weight of a body varies with its location, the weights of various standards of mass are often used as units of force as,—pound weight, or pound force, gram weight, etc. The weight of mass m, where g is the acceleration due to gravity,

$$W = mg.$$

The weight will be given in dynes when m is in grams and g in cm per sec^2.

Wheatstone's bridge.—If the resistances r_1, r_2, r_3, and r_4 form the arms of a Wheatstone's bridge in order as the circuit (omitting cell and galvanometer connections) is traced, when the bridge is balanced,

$$\frac{r_1}{r_2} = \frac{r_4}{r_3} \quad \text{or} \quad \frac{r_1}{r_4} = \frac{r_2}{r_3}$$

Wien's displacement law.—When the temperature of a radiating black body increases, the wave length corresponding to maximum energy decreases in such a way that the product of the absolute temperature and wave length is constant.

$$\lambda_{max} T = w$$

w is known as **Wien's displacement constant.**

Work.—When a force acts against resistance to produce motion in a body the force is said to do work. Work is measured by the product of the force acting and the distance moved through against the resistance. Cgs units of work,—the erg, a force of one dyne acting through a distance of one centimeter. The joule is 1×10^7 ergs. Dimensions,—$[m\, l^2\, t^{-2}]$. The foot-pound is the work required to raise a mass of one pound a vertical distance of one foot where $g = 32.174$ ft./sec^2. The foot-poundal is the work done by a force of one poundal acting through a distance of one foot. The International joule, a unit of electrical energy, is the work expended per second by a current of one International ampere flowing through one International ohm. The kilowatt-hour is the total amount of energy developed in one hour by a power of one kilowatt.

If a force F act through a space s, the work done is

$$W = Fs$$

Work will be given in ergs if F is in dynes and s in cm.

Work done in rotation. If a torque L dyne-cm acts through an angle θ radians, the work done in ergs is

$$W = L\theta$$

X-rays.—A type of radiation of higher frequency than visible light but lower than gamma rays. Usually produced by high energy electrons impinging upon a metal target.

X units.—X-ray wavelengths have been measured in two kinds of units. The older measurements are given in X units (XU) which are based on the effective lattice constant of rock salt being 2,814.00 XU. More recently X-ray wavelengths have been directly connected, through measurements with ruled gratings, to the wavelengths in the optical region and through them to the standard meter. It turned out that the XU which was originally intended as 10^{-11} cm was 0.202 per cent larger than this value. It has become customary to give X-ray wavelengths in Angstrom units (Å) when the absolute scale is used (1 Å = 10^{-8} cm). The two are related by

$$1{,}000 \text{ XU} = 1.00202 \pm 0.00003) \text{ Å}$$

and wavelengths given in XU must be multiplied by 1.00202 and then divided by 1,000 in order to convert them into Angstrom units.

Zeeman effect.—The splitting of a spectrum line into several symmetrically disposed components, which occurs when the source of light is placed in a strong magnetic field. The components are polarized, the directions of polarization and the appearance of the effect depending on the direction from which the source is viewed relative to the lines of force.

Wave number	1 per meter	m^{-1}	
Work, energy, quantity of heat	joule	J	$(N{\cdot}m)$

Supplementary Tables

Definition of Most Important International System (SI) Units

The *ampere* (unit of electric current) is the constant current which, if maintained in two straight parallel conductors of infinite length, of negligible circular sections, and placed 1 meter apart in a vacuum, will produce between these conductors a force equal to 2×10^{-7} newton per meter of length.

Antiferromagnetic Materials: Those in which the magnetic moments of atoms or ions tend to assume an ordered arrangement in zero applied field, such that the vector sum of the moments is zero, below a characteristic temperature called the Néel Point. The permeability of antiferromagnetic materials is comparable to that of paramagnetic materials. Above the Néel Point, these materials become paramagnetic.

Candela. The candela is the luminous intensity, in the direction of the normal, of a black body surface 1 600,000 square meter in area, at the temperature of solidification of platinum under a pressure of 101,325 newtons per square meter.

Compensation Point: The temperature (below the Néel Point) at which, in some ferrimagnetic compounds, the saturation magnetization becomes zero.

The *coulomb* (unit of quantity of electricity) is the quantity of electricity transported in 1 second by a current of 1 ampere.

Diamagnetic Materials: Those within which the magnetic induction is slightly less than the applied magnetic field. Diamagnetism is an atomic scale consequence of the Lenz law of induction. For diamagnetic materials, the permeability is slightly less than that of empty space, and the magnetic susceptibility is negative and small.

The ephemeris *second* (unit of time) is exactly 1/31 556 925.974 7 of the tropical year of 1900, January, 0 days, and 12 hours ephemeris time.

The *farad* (unit of electric capacitance) is the capacitance of a capacitor between the plates of which there appears a difference of potential of 1 volt when it is charged by a quantity of electricity equal to 1 coulomb.

Ferrimagnetic Materials: Those in which the magnetic moments of atoms or ions tend to assume an ordered but nonparallel arrangement in zero applied field, below a characteristic temperature called the Néel Point. In the usual case, within a magnetic domain, a substantial net magnetization results from the antiparallel alignment of neighboring *nonequivalent* sublattices. The macroscopic behavior is similar to that in ferromagnetism. Above the Néel Point, these materials become paramagnetic.

Ferromagnetic Materials: Those in which the magnetic moments of atoms or ions in a magnetic domain tend to be aligned parallel to one another in zero applied field, below a characteristic temperature called the Curie Point. Complete ordering is achieved only at the absolute zero of temperature. Within a magnetic domain, at absolute zero, the magnetization is equal to the sum of the magnetic moments of the atoms or ions per unit volume. Bulk matter, consisting of many small magnetic domains, has a net magnetization which depends upon the magnetic history of the specimen (hysteresis effect). The permeability depends on the magnetic field, and can reach values of the order of 10^6 times that of free space. Above the Curie Point, these materials become paramagnetic.

The *henry* (unit of electric inductance) is the inductance of a closed circuit in which an electromotive force of 1 volt is produced when the electric current in the circuit varies uniformly at a rate of 1 ampere per second.

International Practical Kelvin Temperature Scale of 1960 and the *International Practical Celsius Temperature Scale* of 1960 are defined by a set of interpolation equations based on the following reference temperatures:

	°K	°C
Oxygen, liquid-gas equilibrium	90.18	−182.97
Water, solid-liquid equilibrium	273.15	0.00
Water, solid-liquid-gas equilibrium	273.16	0.01
Water, liquid-gas equilibrium	373.15	100.00
Zinc, solid-liquid equilibrium	692.655	419.505
Sulphur, liquid-gas equilibrium	717.75	444.6
Silver, solid-liquid equilibrium	1233.95	960.8
Gold, solid-liquid equilibrium	1336.15	1063.0

The *joule* (unit of energy) is the work done when the point of application of 1 newton is displaced a distance of 1 meter in the direction of the force.

Kelvin: The kelvin, the unit of thermodynamic temperature, is the fraction 1/273.16 of the thermodynamic temperature of the triple point of water. The decision was made at the 13th General Conference on Weights and Measures on October 13, 1967 that the name of the unit of thermodynamic temperature would be changed from *degree Kelvin* (symbol: °*K*) to *kelvin* (symbol: *K*). The name (*kelvin*) and symbol (*K*) are to be used for expressing temperature intervals. The former convention which expressed a temperature interval in *degrees Kelvin* or, abbreviated, *deg. K* is dropped. However, the old designations are acceptable temporarily as alternatives to the new ones. One may also express temperature intervals in *degrees Celsius.*

The *kilogram* (unit of mass) is the mass of a particular cylinder of platinum- iridium alloy, called the International Prototype Kilogram, which is preserved in a vault at Sèvres, France, by the International Bureau of Weights and Measures.

Length: The name "micron", for a unit of length equal to 10^{-6} meter, and the symbol "μ" which has been used for it were dropped by action of the 13th General Conference on Weights and Measures on October 13, 1967. The symbol "μ" is to be used solely as an abbreviation for the prefix "micro-", standing for the multiplication by 10^{-6}. Thus the length previously designated as 1 micron, should be designated 1 μm.

The *lumin* (unit of luminous flux) is the luminous flux emitted in a solid angle of 1 steradian by a uniform point source having an intensity of 1 candela.

Magnetic Anisotropy: In ferro- or ferrimagnetic crystals, it is found that the magnetization prefers to lie along certain crystal directions. These are termed *easy directions* of magnetization. Work must be expended to turn the magnetization away from these easy directions. That work as a function of crystal direction defines the *anisotropy energy surface.* Directions associated with a maximum of the anisotropy energy are termed *hard directions* of magnetization. In general, the energy difference between easy and hard directions decreases as the temperature is increased, and vanishes at the Curie or Néel point.

Magnetic Domains: The magnetization of a ferromagnetic or a ferrimagnetic material tends to break up into regions called *domains* separated by thin transition regions called *domain walls.* Within the volume of a domain, the magnetization has its saturation value, and is directed along a single direction. The magnetizations of other domains are directed along different directions in such a way that the net magnetization of the whole sample may be zero. The application of an external magnetic field first causes some domains to grow by the motion of their walls. At higher fields, the magnetizations of the resulting domains rotate toward parallelism with the field.

Magnetostriction: Change in sample dimensions as the magnitude or the direction of the magnetization in a crystal is changed.

Metamagnetic Materials: Those which are antiferromagnetic in weak fields, but which become ferromagnetically ordered in strong applied fields.

The *meter* (unit of length) is the length of exactly 1 650 763.73 wavelengths of the radiation in vacuum corresponding to the unperturbed transition between the levels $2p_{10}$ and $5d_5$ of the atom of Krypton 86, the orange-red line.

Néel Point: The temperature at which ferrimagnetic and antiferromagnetic materials become paramagnetic.

The *newton* (unit of force) is that force which gives to a mass of 1 kilogram an acceleration of 1 meter per second.

The *ohm* (unit of electric resistance) is the electric resistance between two points of a conductor when a constant difference of potential of 1 volt, applied between these two points, produces in this conductor a current of 1 ampere, this conductor not being the source of any electromotive force.

Paramagnetic Materials: Those within which the magnetic induction is slightly greater than the applied magnetic field. Paramagnetism arises from the partial alignment of the permanent magnetic dipole moments of atoms or ions. The permeability is slightly greater than that of empty space, and the magnetic susceptibility is positive and small.

Second: The second is the unit of time of the International System of Units. The definition adopted at the October 13, 1967 meeting of the 13th General Conference on Weights and Measures is: "The second is the duration of 9,192,631,770 periods of the radiation corresponding to the transition between the two hyperfine levels of the fundamental state of the atom of cesium 133." The frequency (9,192,631,770 Hz) which the definition assigns to the cesium radiation was carefully chosen to make it impossible, by any existing experimental evidence, to distinguish the new second from the "ephemeris second" based on the earth's motion. Therefor no changes need to be made in data stated in terms of the old standard in order to convert them to the new one. The atomic definition has two important advantages over the previous definition: (1) it can be realized (i.e., generated by a suitable clock) with sufficient precision, ± 1 part per hundred billion (10^{11}) or better, to meet the most exacting demands of modern metrology; and (2) it is available to anyone who has access to or who can build an atomic clock controlled by the specified cesium radiation. (A description of such clocks is given in "Atomic Frequency Standards," *NBS Tech. News Bull.* 45, 8–11 (Jan., 1961). For more recent developments and technical details, see R. E. Beehler, R. C. Mockler, and J. M. Richardson, "Cesium Beam Atomic Time and Frequency Standards," *Metrologia* 1, 114–131 (July, 1965)). In addition one can compare other high-precision clocks directly with such a standard in a relatively short time—an hour or so compared against years with the astronomical standard. Laboratory-type atomic clocks are complex and expensive, so that most clocks and frequency generators will continue to be calibrated against a standard such as the NBS Frequency Standard, controlled by a cesium atomic beam, at the Radio Standards Laboratory in Boulder, Colorado. In most cases the comparison will be by way of the standard-frequency and time-interval signals broadcast by NBS radio stations WWV, WWVH, WWVB, and WWVL.

The *volt* (unit of electric potential difference and electromotive force) is the difference of electric potential between two points of a conducting wire carrying a constant current of 1 ampere, when the power dissipated between these points is equal to 1 watt.

The *watt* (unit of power) is the power which gives rise to the production of energy at the rate of 1 joule per second.

The *weber* (unit of magnetic flux) is the magnetic flux which, linking a circuit of one turn, produces in it an electromotive force of 1 volt as it is reduced to zero at a uniform rate in 1 second.

Definitions of the most important SI Units are given in the above Supplementary Tables. These definitions have been extracted from the records of the International Committee and the General Conferences.

TEMPERATURE CONVERSION TABLE

This table permits one to convert from degrees Celcius to degrees Fahrenheit or from degrees Fahrenheit to degrees Celcius. The conversion is accomplished by first locating in a column printed in bold face type the number that is to be converted. If the number to be converted is in degrees Fahrenheit, one may find its equivalent in degrees Celcius by reading to the left. If the number to be converted is in degrees Celcius, one may find its equivalent in degrees Fahrenheit by reading to the right. Degrees Celcius are identical to degrees Centigrade. However, the word Celcius is preferred for international use.

The approved international symbolic abbreviation for degrees Celcius is °C, whereas for degrees Fahrenheit it is °F. Absolute zero on the Celcius scale is −273.15°C; on the Fahrenheit scale it is −459.67°F. The relation between degrees Fahrenheit and degrees Celcius may be expressed by

$$°C = 5/9(°F - 32) \text{ or}$$
$$°F = 9/5(°C) + 32.$$

ALLOWABLE CARRYING CAPACITIES OF CONDUCTORS

(National Electrical Code)

The ratings in the following tabulation are those permitted by the National Electrical Code for flexible cords and for interior wiring of houses, hotels, office buildings, industrial plants, and other buildings.

The values are for copper wire. For aluminum wire the allowable carrying capacities shall be taken as 84% of those given in the table for the respective sizes of copper wire with the same kind of covering.

Size A.W.G.	Area Circular Mils	Diameter of Solid Wires Mils	Rubber Insulation Amperes	Varnished Cambric Insulation Amperes	Other Insulations and Bare Conductors Amperes
18	1,624.	40.3	3*	...	6†
16	2,583.	50.8	6*	...	10†
14	4,107.	64.1	15	18	20
12	6,530.	80.8	20	25	30
10	10,380.	101.9	25	30	35
8	16,510.	128.5	35	40	50
6	26,250.	162.0	50	60	70
5	33,100.	181.9	55	65	80
4	41,740.	204.3	70	85	90
3	52,630.	229.4	80	95	100
2	66,370.	257.6	90	110	125
1	83,690.	289.3	100	120	150

000	167,800.	409.6	175	210	275
0000	211,600.	460	225	270	325

1 Mil = 0.001 inch.

* The allowable carrying capacities of No. 18 and 16 are 5 and 7 amperes respectively, when in flexible cords.

† The allowable carrying capacities of No. 18 and 16 are 10 and 15 amperes respectively, when in cords for portable heaters. Types AFS, AFSJ, HC, HPD, and HSJ.

CROSS-SECTION AND MASS OF WIRES

U. S. Measure

Diameters are given in mils (1 mil = .001 in.), and area in square mils (1 sq. mil = .000001 sq. in.). For sections and masses for one-tenth the diameters given, divide by 100 and for sections and masses for ten times the diameter multiply by 100.

Diam. in mils	Cross-sec. in sq. mils	Pounds per foot			
		Copper, density 8.90	Iron, density 7.80	Brass, density 8.56	Aluminum, density 2.67

CROSS-SECTION AND MASS OF WIRES (Continued)

Metric Measure

Diameters are given in thousandths of a centimeter and area of section in square thousandths of a centimeter. 1 $(cm/1000)^2$ = .000001 sq. cm For sections and masses for diameters 1/10 or 10 times those of the table, divide or multiply by 100.

RESISTANCE OF WIRES

The following table gives the approximate resistance of various metallic conductors. The values have been computed from the resistivities at 20°C, except as otherwise stated, and for the dimensions of wire indicated. Owing to differences in purity in the case of elements and of composition in alloys, the values can be considered only as approximations.

The following dimensions have been adopted in the computations.

B. & S. gauge	Diameter		B. & S. gauge	Diameter	
	mm	mils 1 mil = .001 in.		mm	mils 1 mil = .001 in.

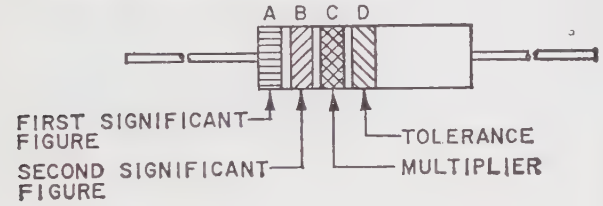
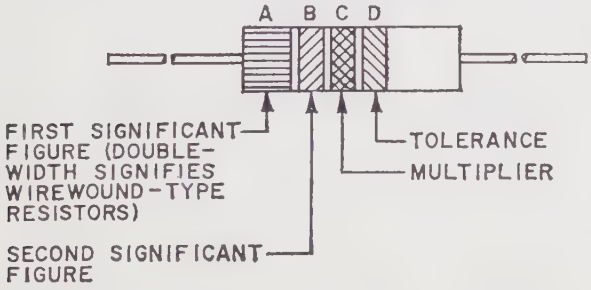
COLOR CODE FOR RESISTORS

GENERAL REQUIREMENTS



Code Colors. Colors used for color coding shall conform to Standard MIL–STD–174, and shall be permanent and nonfading. The color-code marking shall remain legible after the resistor has been subjected to all the tests specified in the individual resistor specification.

Body Colors (Background). The exterior body color of resistors shall be any color other than black; for composition-type resistors, tan is preferred, for wire-wound-type resistors, brown is preferred.



Conflict of Colors. When the body color is the same as any of the band colors, then either the body color or the band color shall be differentiated by shade or gloss.

Band A		Band B		Band C		Band D	
Color	First significant figure	Color	Second significant figure	Color	Multiplier	Color	Resistance tolerance (per cent)
Black	0	Black	0	Black	1	Silver	±10
Brown	1	Brown	1	Brown	10	Gold	±5
Red	2	Red	2	Red	100		
Orange	3	Orange	3	Orange	1,000		
Yellow	4	Yellow	4	Yellow	10,000		
Green	5	Green	5	Green	100,000		
Blue	6	Blue	6	Blue	1,000,000		
Purple (viole.	7	Purple (violet)	7	. . .	. . .		
Gray	8	Gray	8	Silver	0.01		
White	9	White	9	Gold	0.1		

COLOR CODE FOR RESISTORS (Not wire wound)

COLOR CODE FOR RESISTORS (Wire wound)

Band A—The first significant figure of the resistance value. (For composition-type resistors, all bands shall be of equal width. For wire-wound-type resistors, band A shall be double width.)

Band B—The second significant figure of the resistance value.

Band C—The multiplier. (The multiplier is the factor by which the two significant figures are multiplied to yield the nominal resistance value.)

Band D—The resistance tolerance.

Examples of color coding

3,900 ohms ±10 percent—Band A, orange; band B, white; band C, red; band D, silver.

43,000 ohms ±5 percent—Band A, yellow; band B, orange; band C orange; band D, gold.

[a] Total other elements requirement pertains only to the metallic elements for this filler metal.

[b] These chemical requirements pertain only to the copper oxide and do not include requirements for the organic vehicle in which the copper oxide is suspended.

[c] Total other elements requirement pertains only to metallic elements for this filler metal. The following limitations are placed on the nonmetallic elements:

Constituent	per cent (max)
Chlorides	0.4
Sulfates	0.1
Oxygen	remainder
Nitric acid insoluble	0.3
Acetone soluble matter	0.5

[d] Total other elements, including the elements marked with an asterisk (*), shall not exceed the value specified.

[e] This AWS-ASTM classification is intended to be identical with the same classification that appears in the Specification for Copper and Copper-Alloy Welding Rods (AWS Designation A5.7; ASTM Designation B 259).[3]

ACCELERATION DUE TO GRAVITY AND LENGTH OF THE SECONDS PENDULUM

For Sea Level at Various Latitudes

Based on the formula of the U. S. Coast and Geodetic Survey. The length of the simple pendulum whose period is two seconds, that is which beats seconds, is computed in each case from the corresponding value of the acceleration.

Latitude	Acceleration due to gravity		Length of seconds pendulum	
°	cm/sec.²	ft./sec.²	cm	in.
0	978.039	32.0878	99.0961	39.0141

DATA IN REGARD TO THE EARTH

Equatorial radius, 6,378,390 meters, 3,963.34 miles.
Polar radius, 6,356,910 meters, 3,949.99 miles.
Radius of sphere having same volume, 6,371,220 meters, 3,958.89 miles.
Quadrant of the equator, 10,019,150 meters, 6,225.60 miles.
Quadrant of the meridian, 10,002,290 meters, 6,215.12 miles.
1° latitude at the equator = 69.41 miles
1° latitude at the pole = 68.70 miles.
Mean density of the earth, 5.522 g/cm³, 344.7 lb./ft.³
Mass of the earth, 5.983×10^{24} kg, 6.595×10^{21} tons.
Mean surface density of the continents, 2.67 g/cm³, 166.7 lb./ft.³
Mean linear velocity of the earth in its orbit, 29.77 km/sec., 18.50 mi./sec.
Mean linear velocity of rotation of the surface at the equator, 0.465 km/sec., 0.289 mi./sec.

DATA IN REGARD TO THE EARTH (Continued)

Land area, 148.847×10^6 km², 57.470×10^6 sq. mi.
Ocean area, 361.254×10^6 km², 139.480×10^6 sq. mi.
Highest mountain, Everest, 8840 meters, 29,003 ft.
Greatest sea depth, 10,430 meters, 34,219 ft.
Thermal gradient of the earth, higher at increasing depths, 30° C per km, 48° C per mi. (uncertain).
Mean distance to the sun, 149,500,000 km or 92,900,000 mi.
Mean distance to the moon, 384,393 km or 238,854 mi.

THE COMMONER CHEMICAL ELEMENTS IN THE EARTH'S CRUST

Reprinted from "Principles of Geochemistry" (1952) with the permission of Brian Mason, author, and John Wiley and Sons, publishers.
The "Earth's Crust" refers to the rocks only and does not include atmosphere or the oceans. The atom percent column is obtained by dividing the weight percent by the atomic weights and reducing to 100%. The radius is the ionic radius. The volume percent is the atomic percent multiplied by $\frac{4}{3}\pi r^3$ and reducing to 100%.

Element	Weight %	Atom %	Ion Radius (Å)	Volume %
O	46.60	62.55	1.32	91 97

ATMOSPHERIC AND METEOROLOGICAL DATA

Total mass of the atmosphere, estimated by Ekholm, 5.2×10^{21} g, 11.4×10^{18} pounds, 5.70×10^{15} tons.

Evidence of extent: twilight, 63 km, 39 mi.; meteors, 200 km, 124 mi.; aurora 44–360 km, 27–224 mi.

* Distance to Earth.

INTERPLANETARY ORBITS

Compiled by D. F. Lawden

Cm., gm., sec., units are to be assumed everywhere unless otherwise stated.

Table A

If M is the mass of an astronomical body and γ is the universal gravitational constant, the attraction on unit mass distant r from the centre of the body, is

$$\frac{\gamma M}{r^2} = \frac{\mu}{r^2}$$

For the Sun $\mu = 1.33 \times 10^{26}$, and for the Moon $\mu = 4.90 \times 10^{18}$. The values taken by μ for the planets will be found in the table.

R is the radius of an astronomical body. For the Sun $R = 6.95 \times 10^{10}$ and for the Moon $R = 1.74 \times 10^{8}$.

V is the velocity a planet would have if it were placed in a circular orbit about the Sun, the radius of this orbit being equal to the semi-major axis of its actual orbit.

V_e is the escape velocity from the visible surface of the planet.

a is the semi-major axis of a planet's orbit. For the Earth, $a = a_0 = 1.4967 \times 10^{13}$. For the Moon's orbit about the Earth $a = 3.82 \times 10^{10}$. a/a_0 for the planets is given in the table.

T is the sidereal period of the planet's motion in *days*.

e is the eccentricity of a planet's orbit.

i is the inclination of the plane of a planetary orbit to the ecliptic.

Ω is the longitude of the ascending node of a planet's orbit.

ω is the longitude of perihelion.

γ g is the gravitational acceleration at the Earth's surface ng is the same quantity for a planet measured at its visible surface. g = 981.

Planets	R	V	μ	V_e	a/a_0

Table B

In each cell of this table, the upper figure represents the net velocity increment in *Km/sec* which must be given to a space vehicle by its motor to effect transfer between two planets and the lower figure is the time of transit between the planets in days. In computing these results, the actual planetary orbits were approximated by circles in the plane of the ecliptic or radii equal to the semi-major axes of the actual orbits and the transfer orbit was assumed to be an ellipse tangential at its apsis to the two terminal orbits. The transfer was assumed to take place between a launching point on the visible surface of the planet of departure and an arrival point on the visible surface of the target planet. One impulsive thrust from the motor was supposed applied at the planet of departure and one at the planet of arrival, the motor being inoperative at all other times. Atmospheric resistances were neglected.

STANDARD ATMOSPHERE

U. S. Extension to International Civil Aviation Organization Standard Atmosphere, 1958

The atmosphere was classified in 1958 into three altitude regions designated as

a. Standard 0 to 32 standard geopotential kilometers
b. Tentative 32 to 75 " " "
c. Speculative 75 to 300 " " "

Properties of the atmosphere were calculated as functions of geometric altitude as well as geopotential, the potential being established for the latitude where the acceleration of gravity has a sea-level value of 9.80665 meters per second per second. Symbols and abbreviations used in these tables are as follows:

H = Altitude in geopotential measure
L_M = Molecular-scale-temperature gradient
M = Mean molecular weight of air
m = Meter
m′ = Standard geopotential meter
P = Pressure
ρ = Mass density
T = Temperature in absolute thermodynamic scales
T_M = Molecular-scale temperature in absolute thermodynamic scales
Z = Altitude in geometric measure

Relationship between Geopotential and Geometric Altitude

The concept originally introduced by Bjerknes expresses vertical displacement in units of geopotential. Geopotential at an altitude Z is the potential energy of a unit mass at that altitude relative to the potential energy of that same unit mass at sea level. *Geopotential* H of a point at altitude Z may be rigorously defined as the increase in potential energy of a unit mass lifted from mean sea level to Z against the local force of gravity. Mathematically this definition becomes,

$$GH = \frac{\Delta E}{m} = \int_o^Z g(Z)\mathrm{d}Z$$

where

ΔE = increase in potential energy in joules,
m = mass of the body in kilograms,
$g(Z)$ = acceleration of gravity in m sec^{-2} expressed as a function of Z,
H = geopotential of a point at altitude Z,
G = proportionality factor depending on the units of H.

Solving this equation for H in terms of Z yields:

$$H = \frac{1}{G}\int_o^Z g(Z)\mathrm{d}Z.$$

The differential form of this relationship to be used later is

$$G\mathrm{d}H = g(Z)\mathrm{d}Z.$$

The basic unit of geopotential in these tables is one *standard geopotential* meter, m′, which is defined as 9.80665 $\mathrm{m}^2\ \mathrm{sec}^{-2}$ and which is equal to the vertical distance through which a one-kilogram mass must be lifted against the local force of gravity to increase its potential energy by 9.80665 joules. If the acceleration of gravity were constant at 9.80665 m sec^{-2} over an altitude interval of one geometric meter, one *standard geopotential* meter would be exactly equal to one geometric meter; this condition is true within two parts in a million at 45° 32′ 33″ at sea level, where g is equal to 9.80665 m sec^{-2}.

Relationship between Temperature and Molecular-scale Temperature

The molecular-scale temperature introduced by Minzner and Ripley is the defining atmospheric property of this Extension. This property is a composite of temperature and molecular weight, and is defined by the equation:

$$T_M = \left(\frac{T}{M}\right) M_o$$

where

T = temperature in the absolute thermodynamic scales,
T_M = molecular-scale temperature in the absolute thermodynamic scales,
M = molecular weight (nondimensional),
M_o = sea-level value of molecular weight.

No direct measurements of temperature have been made at altitudes above those which are reached by balloons; instead, the temperature is derived from values of the velocity of sound, or by substitution of measured pressures or densities into the barometric equation. The molecular-scale temperature can be derived in this way without specifying the molecular weight, whereas the temperature can be derived only if the molecular weight is known. Since the molecular weight is not well known at altitudes above 90 km, the molecular-scale temperature is more precisely known than temperature. Thus, the introduction of molecular-scale temperature increases the validity of some of the tabulated properties while simultaneously decreasing the complexity of the mathematics relating the basic atmospheric properties. The use of molecular-scale temperature also avoids the necessity for changing the defined atmosphere each time new values for the inadequately known molecular-weight distribution may be adopted.

Sea-level Atmospheric Composition for a Dry Atmosphere†

Constituent Gas	Mol. Fraction Per Cent	Molecular Weight (O = 16,000)
Nitrogen (N_2)	78.09	28.016
Oxygen (O_2)	20.95	32.0000
Argon (A)	0.93	39.944
Carbon dioxide (CO_2)	0.03	44.010
Neon (Ne)	1.8×10^{-3}	20.183
Helium (He)	5.24×10^{-4}	4.003
Krypton (Kr)	1.0×10^{-4}	83.7
Hydrogen (H_2)	5.0×10^{-5}	2.0160
Xenon (Xe)	8.0×10^{-6}	131 3
Ozone (O_3)	1.0×10^{-6}	48.0000
Radon (Rn)	6.0×10^{-18}	222.

† These values are taken as standard and do not necessarily indicate the exact condition of the atmosphere. Ozone and Radon particularly are known to vary at sea level and above, but these variations would not appreciably affect the value of M_o.

Sea Level Values of ICAO Atmosphere

Property	Metric Units
Collision frequency	$6.9204049 \times 10^9\ \mathrm{sec}^{-1}$

Atmospheric Electricity

Normal potential gradient:
Over land, 67 to 317 volts/m.
Over sea, 128 volts/m.
Potential gradient at Earth's surface beneath thunder cloud, 1×10^4 volts/m. Quantity discharged by lightning flash, 10–50 coulombs.
Energy of flash, 1×10^{17} ergs.
Potential difference between discharge points, 1×10^9 volts.

Angular Radius of Halos and Rainbows

Coronae due to small water drops	1° to 10°
Small halo, due to 60° angles of ice crystals	22°
Large halo, due to 90° angles of ice crystals	46°
Rainbow, primary	41° 20′
Rainbow, secondary	52° 15′

Solar Constant

The energy falling on one sq. cm. area at normal incidence, outside the earth's atmosphere, at the mean distance of the earth from the sun equals 2.00 small calories per minute. This value varies ±2%.

CRYSTAL IONIC RADII OF THE ELEMENTS

Numerical values of the radii of the ions may vary depending on how they were measured. They may have been calculated from wavefunctions and determined from the lattice spacings or crystal structure of various salts. Different values are obtained depending on the kind of salt used or the method of calculating. Data for many of the rare-earth ions were furnished by F. H. Spedding and K. Gschneidner.

BOND LENGTHS BETWEEN CARBON AND OTHER ELEMENTS

Prepared by Olga Kennard.

The tables are based on bond distance determinations, by experimental methods, mainly X-ray and electron diffraction, and include values published up to January 1, 1956. In the present tables, for the sake of completeness individual values of bond distances of lower accuracy are quoted with limits of error indicated where possible. Values for tungsten and bismuth should be treated with particular caution.

According to the statistical theory of errors if an average quantity $\bar{\mu}$ and a standard deviation σ can be evaluated there is a 95% probability that the true value lies within the interval $\bar{\mu} \pm 2\sigma$. Too much reliance should, however, not be placed on σ values in bond distance determinations since the derivation of these certain sources of error may have been neglected.

Values are given in Ångstrom units and limits of error quoted in units in the last place thus: $2.07 \pm \equiv 2.07 \pm 0.01$.

CARBON-CARBON

Single Bond

Paraffinic	1.541 ± 0.003
In diamond (18°C)	1.54452 ± 0.00014

Partial Double Bond

(1) Shortening of single bond in presence of carbon carbon double bond, e.g. $(CH_3)_2$-C:CH_2; or of aromatic ring e.g. C_6H_5-CH_3	1.53 ± 0.01
(2) Shortening in presence of a carbon oxygen double bond e.g. CH_3CHO	1.516 ± 0.005
(3) Shortening in presence of two carbon-oxygen double bonds, e.g. $(CO_2H)_2$	1.49 ± 0.01
(4) Shortening in presence of one carbon-carbon triple bond; e.g. CH_3.C:CH	1.460 ± 0.003
(5) In compounds with tendency to dipole formation, e.g. C:C.C:N	1.44 ± 0.01
(6) In graphite (at 15°C)	1.4210 ± 0.0001
(7) In aromatic compounds	1.395 ± 0.003
(8) In presence of two carbon carbon triple bonds, e.g. HC:C.C:CH	1.373 ± 0.004

Double Bond

(1) Simple	1.337 ± 0.006
(2) Partial triple bond, e.g. CH_2:C:CH_2	1.309 ± 0.005

Triple Bond

(1) Simple, e.g. C_2H_2	1.204 ± 0.002
(2) Conjugated, e.g. CH_3.(C:C)$_2$.H	1.206 ± 0.004

CARBON-HYDROGEN

(1) Paraffinic (a) in methane	1.091
(b) in monosubstituted carbon	1.101 ± 0.003
(c) in disubstituted carbon	1.073 ± 0.004
(d) in trisubstituted carbon	1.070 ± 0.007
(2) Olefinic, e.g. CH_2:CH_2	1.07 ± 0.01
(3) Aromatic in C_6H_6	1.084 ± 0.006
(4) Acetylenic, e.g. CH:C.X	1.056 ± 0.003
(5) Shortening in presence of a carbon triple bond, e.g. CH_3CN	1.115 ± 0.004
(6) In small rings, e.g. $(CH_2)_2S$	1.081 ± 0.007

BOND LENGTHS BETWEEN CARBON AND OTHER ELEMENTS (Continued)

CARBON-NITROGEN

Single Bond

(1) Paraffinic (a) 4 co-valent nitrogen	1.479	± 0.005
(b) 3 co-valent nitrogen	1.472	± 0.005
(2) In C—N= e.g. CH_3NO_2	1.475	± 0.010
(3) Aromatic in $C_6H_5NHCOCH_3$	1.426	± 0.012
(4) Shortened (partial double bond) in heterocyclic systems, e.g. C_5H_5N	1.352	± 0.005
(5) Shortened (partial double bond) in N—C=O e.g. $HCONH_2$	1.322	± 0.003

Triple Bond

(1) In R.C:N	1.158	± 0.002

CARBON-OXYGEN

Single Bond

(1) Paraffinic	1.43	± 0.01
(2) Strained e.g. epoxides	1.47	± 0.01
(3) Shortened (partial double bond) as in carboxylic acids or through influence of aromatic ring, e.g. salicylic acid	1.36	± 0.01

Double Bond

(1) In aldehydes, ketones, carboxylic acids, esters	1.23	± 0.01
(2) In zwitterion forms, e.g. DL serine	1.26	± 0.01
(3) Shortened (partial triple bond) as in conjugated systems	1.207	± 0.006
(4) Partial triple bond as in acyl halides or isocyanates	1.17	± 0.01

CARBON-SULPHUR

Single Bond

(1) Paraffinic, e.g. CH_3SH	1.81(5)	± 0.01
(2) Lengthened in presence of fluorine, e.g. $(CF_3)_2S$	1.83(5)	± 0.01
(3) Shortened (partial double bond) as in heterocyclic systems, e.g. C_4H_4S	1.73	± 0.01

Double Bond

(1) In ethylene thiourea	1.71	± 0.02
(2) Shortened (partial triple bond) in presence of second carbon double bond, e.g COS	1.558	± 0.003

STRENGTHS OF CHEMICAL BONDS

J. A. Kerr and A. F. Trotman-Dickenson
University of Wales, Aberystwyth
(Revised to 1 January 1967)

The strength of a chemical bond, D(R—X), often known as the bond dissociation energy, is defined as the heat of the reaction: $RX \rightarrow R + X$. It is given by: $D(R—X) = \Delta Hf°(R) + \Delta Hf°(X) - \Delta Hf°(RX)$. Some authors list bond strengths for 0°K but here the values for 25°C are given because more thermodynamic data are available for this temperature. Bond strengths, or bond dissociation energies, are not equal to, and may differ considerably from, mean bond energies derived solely from thermochemical data on molecules and atoms.

BOND STRENGTHS IN DIATOMIC MOLECULES

These have usually been measured spectroscopically and many are known to ± 0.1 kcal. mole^{-1}. All bond strengths are in kcal. mole^{-1} at 25°C. The element of lower atomic number is listed first.

Many references are to: Herzberg, Molecular Spectra and Molecular Structure, I. Spectra of Diatomic Molecules, 2nd Ed., New York, 1950 (Herzberg); Gaydon, Dissociation Energies and Spectra of Diatomic Molecules, 2nd Ed. London, 1953 (Gaydon). The references have been chosen primarily as a key to the literature. It should not be assumed that the author referred to was responsible for the determination quoted. The reference may be only to a review article.

STRENGTHS OF CHEMICAL BONDS (Continued)

HEATS OF FORMATION OF GASEOUS ATOMS FROM ELEMENTS IN THEIR STANDARD STATES

J. A. Kerr and A. F. Trotman-Dickenson

For elements which are diatomic gases in their standard states these are readily obtained from the bond strength. For elements which are crystalline in their standard states they are derived from vapor pressure data. All values are given in kcal. mole^{-1} at 25°C.

BOND STRENGTHS IN POLYATOMIC MOLECULES

J. A. Kerr and A. F. Trotman-Dickenson

These are of very variable reliability. Few are known to better than ±1 kcal. mole^{-1}. An attempt has been made to list all important values obtained by methods that are considered to be valid.

There are some bond strengths which are frequently required in calculations but which are not well established. These are given with a query.

Bond	Kcal. mole^{-1}	Ref.	Bond	Kcal. mole^{-1}	Ref.	Bond	Kcal. mole^{-1}	Ref.

HEATS OF FORMATION OF FREE RADICALS

J. A. Kerr and A. F. Trotman-Dickenson

These are given in kcal. mole^{-1} at 25°C. They are self-consistent with the tables of bond strengths to which reference should be made for the source of the data.

Radical	Kcal. mole^{-1}	Radical	Kcal. mole^{-1}
CH_2	90	CH_3O	2
CH_3	34.0	CH_3CO	−4
C_2H_3	64	CH_3CO_2	−45
C_2H_5	25.7	$C_2H_5CO_2$	−54
C_3H_5	38	$(CH_3)_3CO$	−24
nC_3H_7	21	C_6H_5CO	16
iC_3H_7	17.6	$C_6H_5CO_2$	−64
tC_4H_9	6.7	CF_3	−111
$neoC_5H_{11}$	7.5	CCl_3	19
C_6H_5	72	NH_2	40
$C_6H_5CH_2$	44.6	NH_2	9
CN	109	OH	9.3
CH_3NH	34	HO_2	5
$(CH_3)_2N$	29	HS	33?
C_6H_5NH	48	CH_3S	30?
CHO	7		

BOND STRENGTH OF SOME ORGANIC MOLECULES

Bond strengths, expressed as Kcal mole^{-1}, for some organic molecules of the general formula R—X are presented below. Due to the arrangement of the table and to the species of radicals and atoms involved, one may also find the bond strengths for ammonia, water and the hydrogen halides.

X	H	F	Cl	Br	I	OH	NH_2	OCH_3	CH_3
R									
H	104.18	153	103.1	87.4	71.4	119	103	102	104
CH_3	104	108	84	70	56	91	79	80	88
C_2H_5	98	106	81	69	53	91	78	80	85
i–C_3H_7	94.5	105	81	68	53	92	77	81	83
t–C_4H_9	91	—	79	63	50	91	77	78	80
C_6H_5	104	117	—	71	—	103	92	92	93

Rubidium	181.6	160.7	153.5	145.3
Cesium	173.7	152.2	146.3	139.1

CONSTANTS FOR SATELLITE GEODESY

Defining Constants

1. Number of ephemeris seconds in 1 tropical year (1900)	s	$= 31\ 556\ 925{\cdot}9747$
2. Gaussian gravitational constant, defining the a. u.	k	$= 0{\cdot}017\ 202\ 09895$

Primary Constants

3. Measure of 1 a. u. in meters	A	$= 149\ 600 \times 10^6$
4. Velocity of light in meters per second	c	$= 299\ 792{\cdot}5 \times 10^3$
5. Equatorial radius for Earth in meters	a_e	$= 6\ 378\ 160$
6. Dynamical form-factor for Earth	J_2	$= 0{\cdot}001\ 082\ 7$
7. Geocentric gravitational constant (units: m^3s^{-2})	GE	$= 398\ 603 \times 10^9$
8. Ratio of the masses of the Moon and Earth	μ	$= 1/81{\cdot}30$
9. Sidereal mean motion of Moon in radians per second (1900)	$n_{\mathbb{C}}{}^*$	$= 2{\cdot}661\ 699\ 489 \times 10^{-6}$
10. General precession in longitude per tropical century (1900)	p	$= 5025''.64$
11. Obliquity of the ecliptic (1900)	ϵ	$= 23°27'08''.26$
12. Constant of nutation (1900)	N	$= 9''.210$

Auxiliary Constants and Factors

$k/86400$, for use when the unit of time is 1 second	k'	$= 1{\cdot}990\ 983\ 675 \times 10^{-7}$
Number of seconds of arc in 1 radian		$= 206\ 264{\cdot}806$
Factor for constant of aberration (note 15)	F_1	$= 1{\cdot}000\ 142$
Factor for mean distance of Moon (note 20)	F_2	$= 0{\cdot}999\ 093\ 142$
Factor for parallactic inequality (note 23)	F_3	$= 49853''.2$

Derived Constants

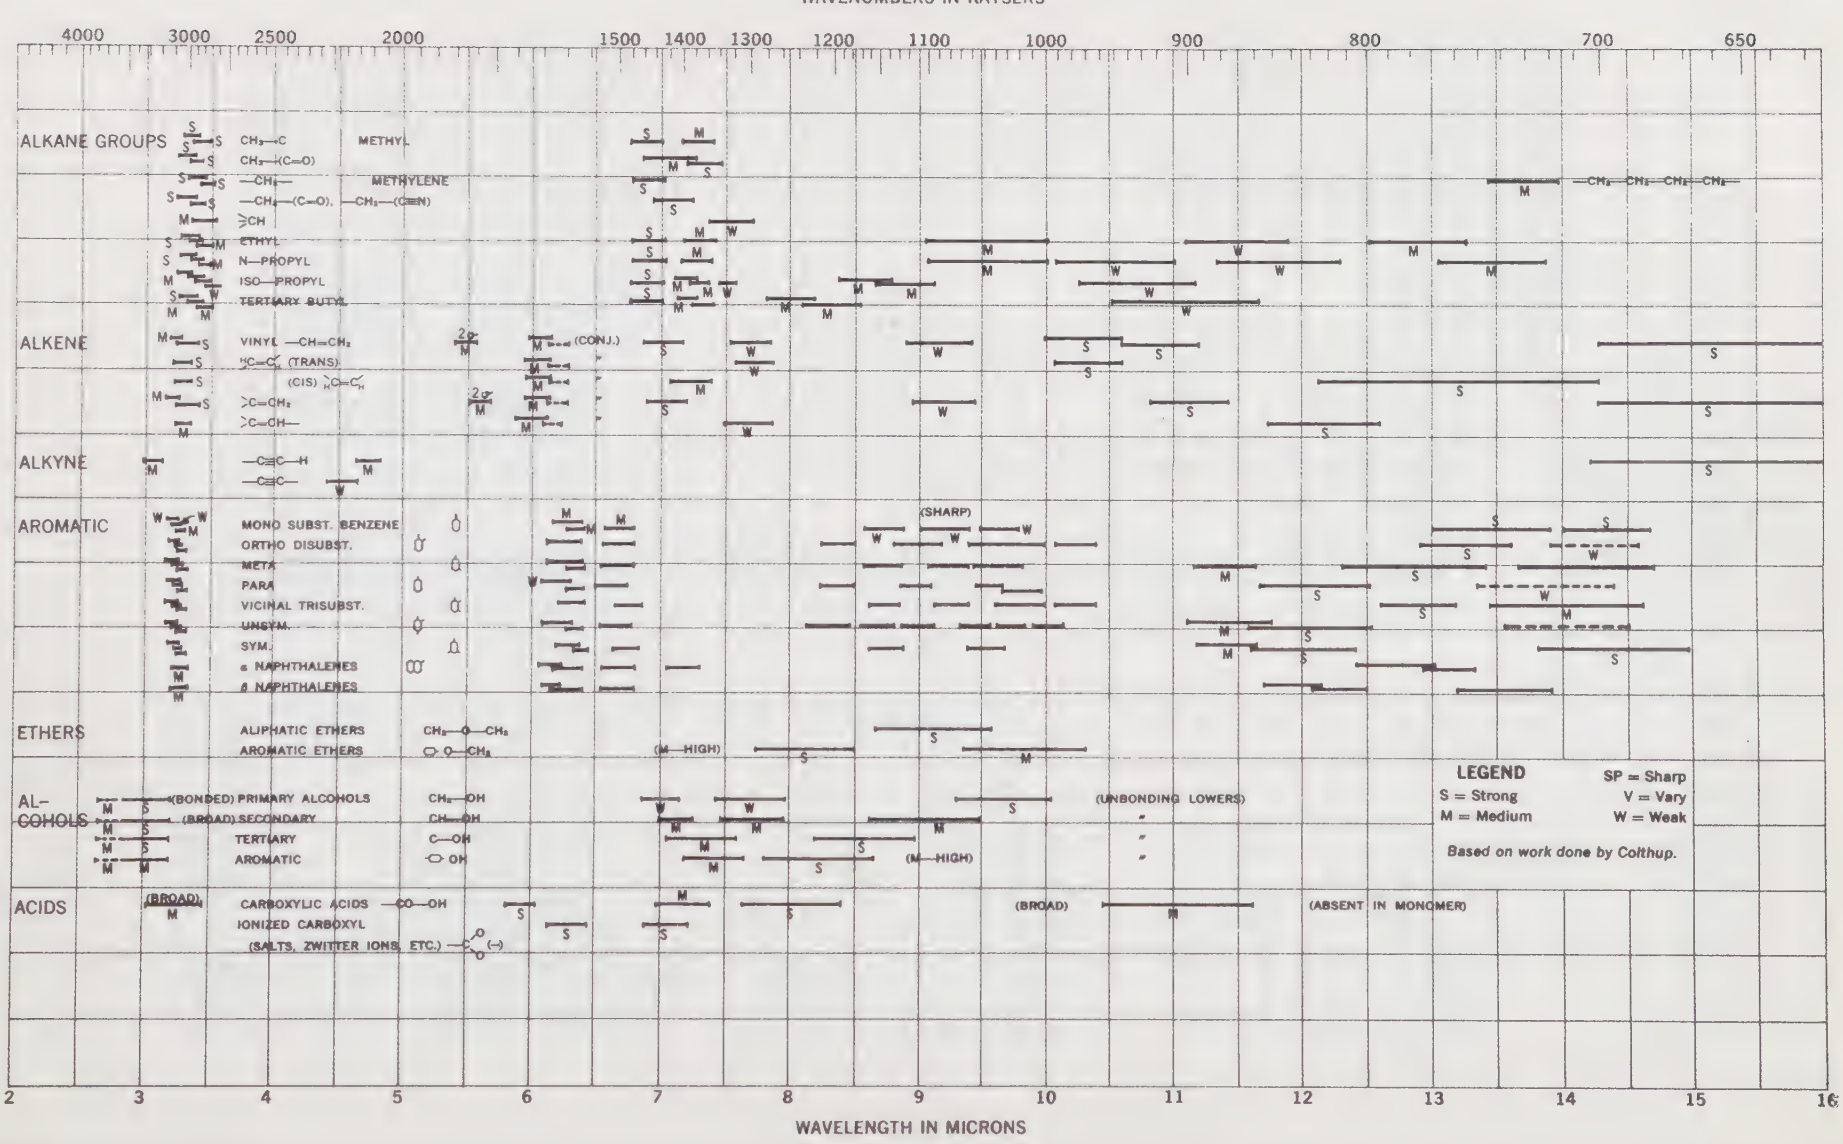
13. Solar parallax	$\arcsin(a_e/A) = \pi_\odot$	$= 8''.79405\ (8''.794)$
14. Light-time for unit distance	$A/c' = \tau_A$	$= 499^s012$
		$= 1^s/0{\cdot}002\ 003\ 96$
15. Constant of aberration	$F_1 k' \tau_A = \kappa$	$= 20''.4958\ (20''.496)$
16. Flattening factor for Earth	f	$= 0{\cdot}003\ 352\ 9$
		$= 1/298{\cdot}25$
17. Heliocentric gravitational constant (units: m^3s^{-2})	$A^3k'^2 = GS$	$= 132\ 718 \times 10^{15}$
18. Ratio of masses of Sun and Earth	$(GS)/(GE) = S\ E$	$= 332\ 958$
19. Ratio of masses of Sun and Earth + Moon	$S/E(1+\mu)$	$= 328\ 912$
20. Perturbed mean distance of Moon, in meters	$F_2(GE(1+\mu)/n_{\mathbb{C}}{}^{*2})^{\frac{1}{3}} = a_{\mathbb{C}}$	$= 384\ 400 \times 10^3$
21. Constant of sine parallax for Moon	$a_e/a_{\mathbb{C}} = \sin \pi_{\mathbb{C}}$	$= 3422''.451$
22. Constant of lunar inequality	$\frac{\mu}{1+\mu}\frac{a_{\mathbb{C}}}{A} = L$	$= 6''.43987\ (6''.440)$
23. Constant of parallactic inequality	$F_3\frac{1-\mu}{1+\mu}\frac{a_{\mathbb{C}}}{A} = P_{\mathbb{C}}$	$= 124''.986$

System of Planetary Masses

	Reciprocal mass		*Reciprocal mass*
24. Mercury	6 000 000	Jupiter	1 047·355
Venus	408 000	Saturn	3 501·6
Earth + Moon	329 390	Uranus	22 869
Mars	3 093 500	Neptune	19 314
		Pluto	360 000

PHYSICAL CONSTANTS

The following lists of physical constants are recommended by the National Academy of Sciences and have been adopted by the National Bureau of Standards. The lists are taken from the National Bureau of Standards Technical News Bulletin, October 1963.



Adjusted Values of Constants

Constant	Symbol	Value	Est.‡ error limit	Unit: Système International (MKSA)		Unit: Centimeter-gram-second (CGS)	
Speed of light in vacuum	c	2.997925	3	$\times 10^{8}$	m s^{-1}	$\times 10^{10}$	cm s^{-1}

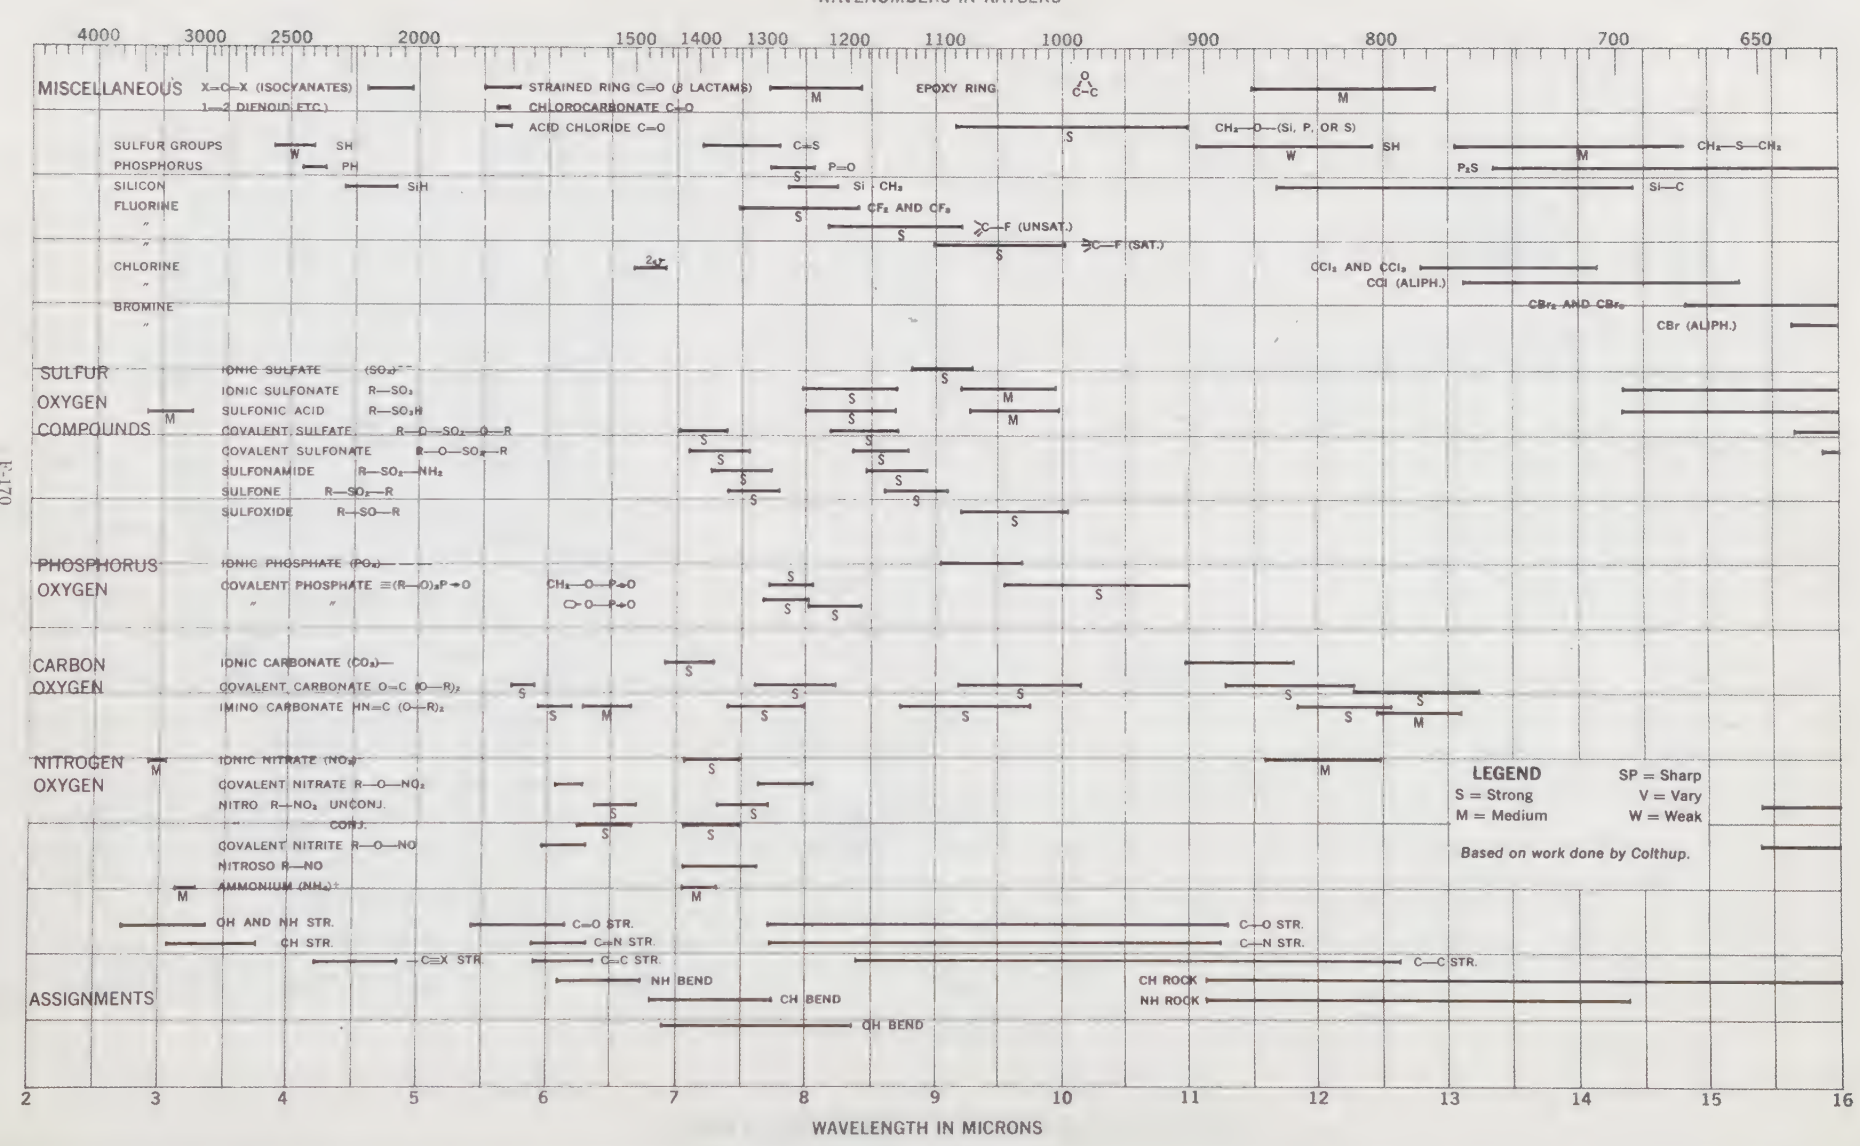
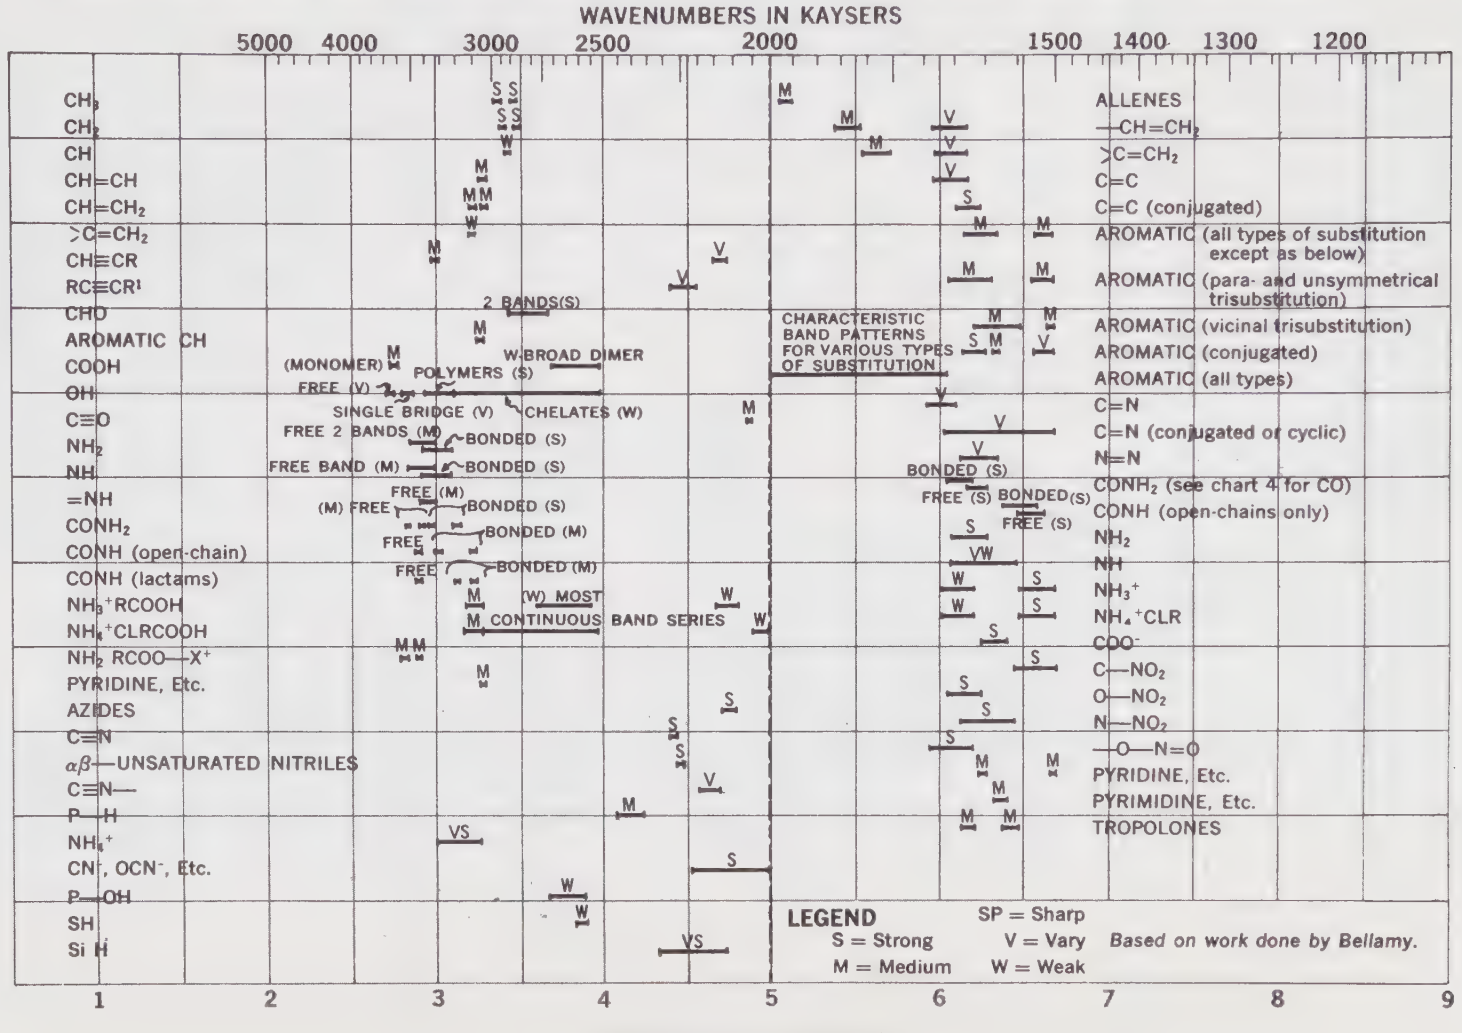
INFRARED CORRELATION CHART No. 1



Prepared from information supplied by Beckman Instruments

INFRARED CORRELATION CHART No. 1 (Con't.)

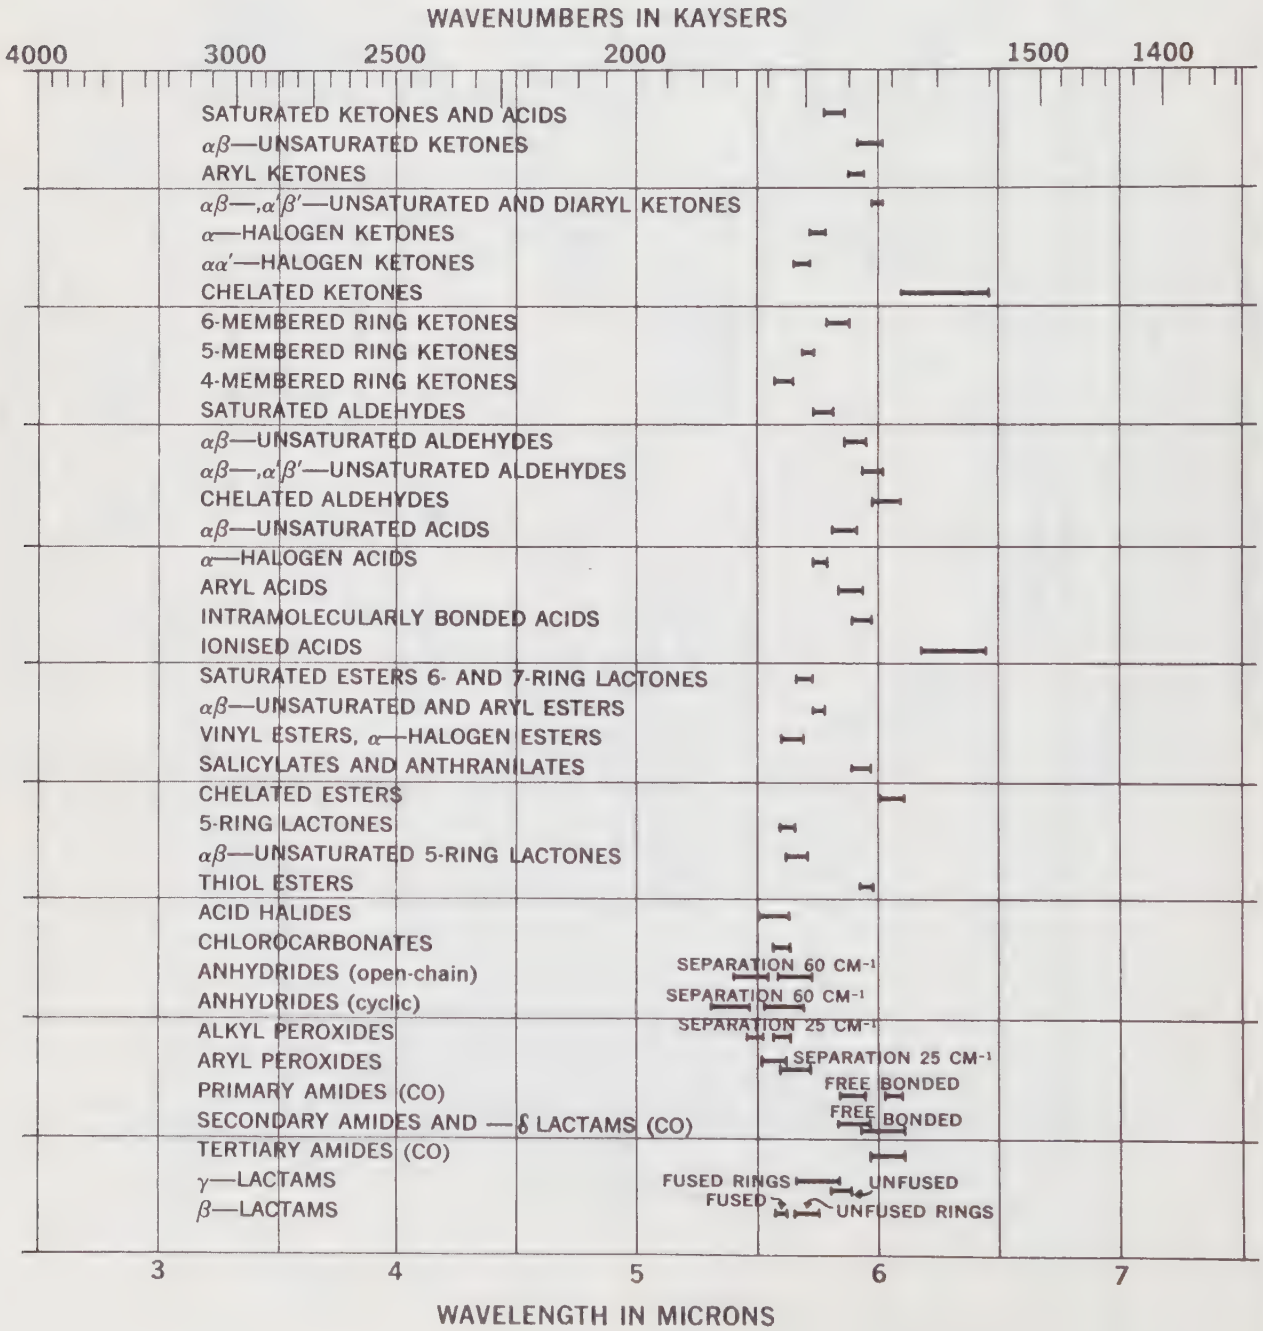
INFRARED CORRELATION CHART No. 1 (Con't.)



INFRARED CORRELATION CHART No. 2

Prepared from information supplied by Beckman Instruments

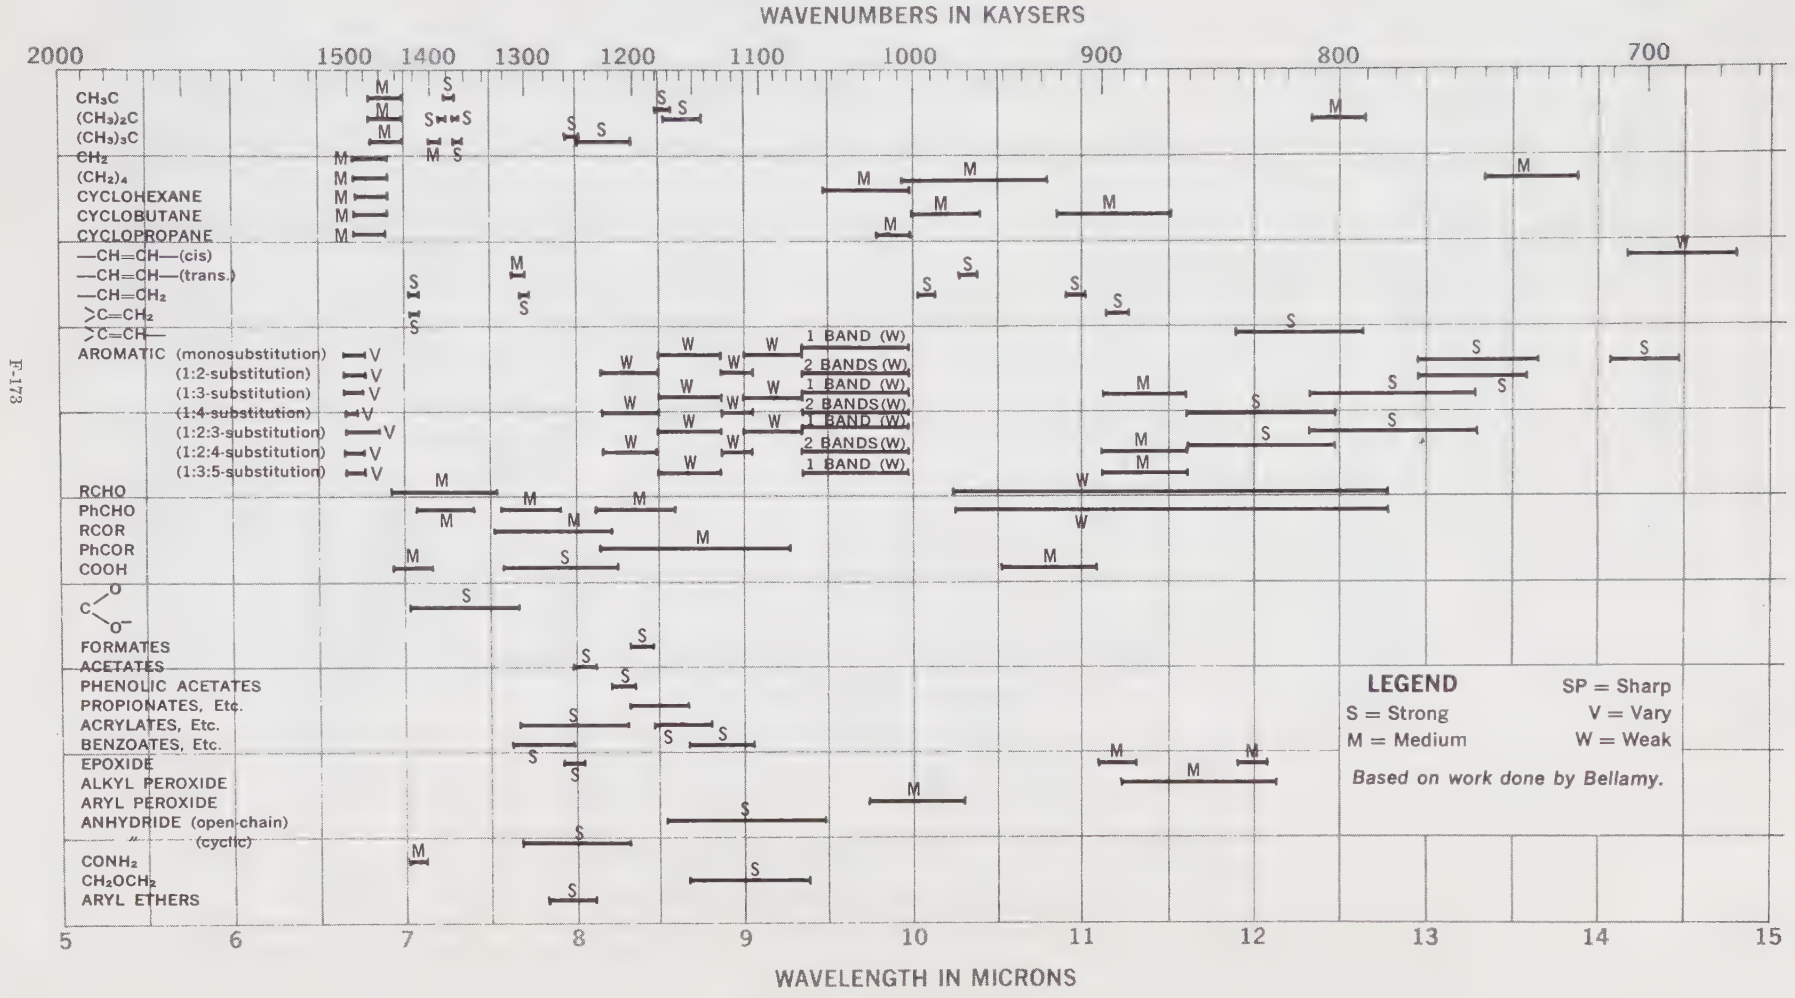
This chart presents some information regarding structure, double-bond vibrations, hydrogen stretching and triple-bond vibrations.



HYDROGEN STRETCHING AND TRIPLE-BOND VIBRATIONS, 3750-2000 CM.$^{-1}$ DOUBLE-BOND VIBRATIONS, ETC. 2000-1500 CM.$^{-1}$

INFRARED CORRELATION CHART No. 3

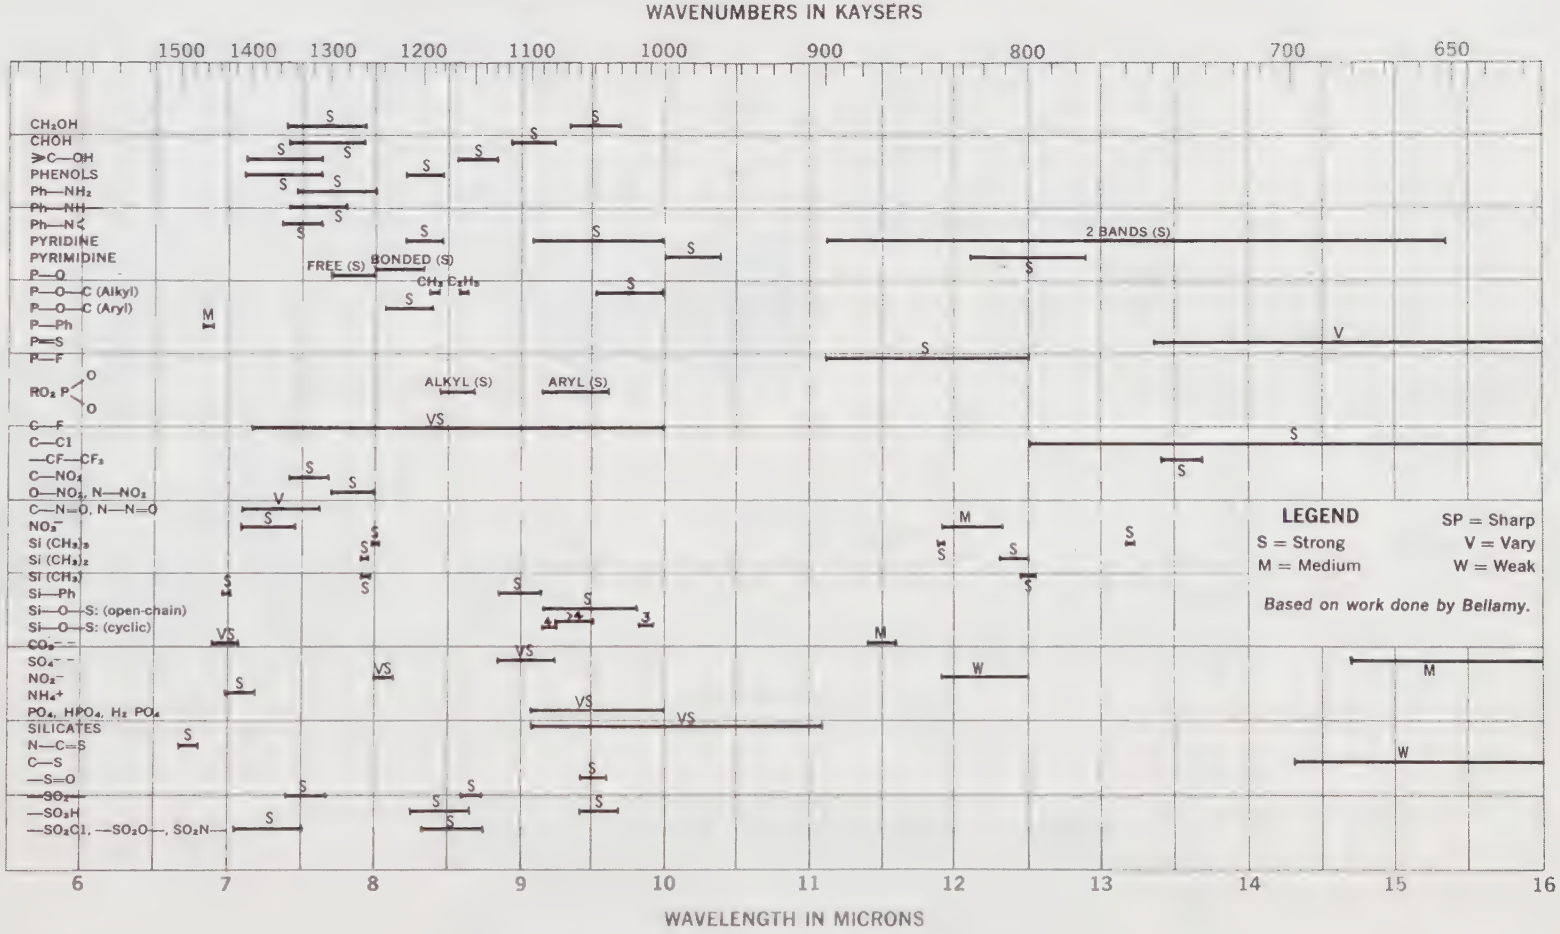
Prepared from information supplied by Beckman Instruments



This chart presents some correlations between structure and the carbonyl vibrations of some classes of organic compounds. In all cases the absorption bands are strong and fall within the range of 1900-1500 cm^{-1}.

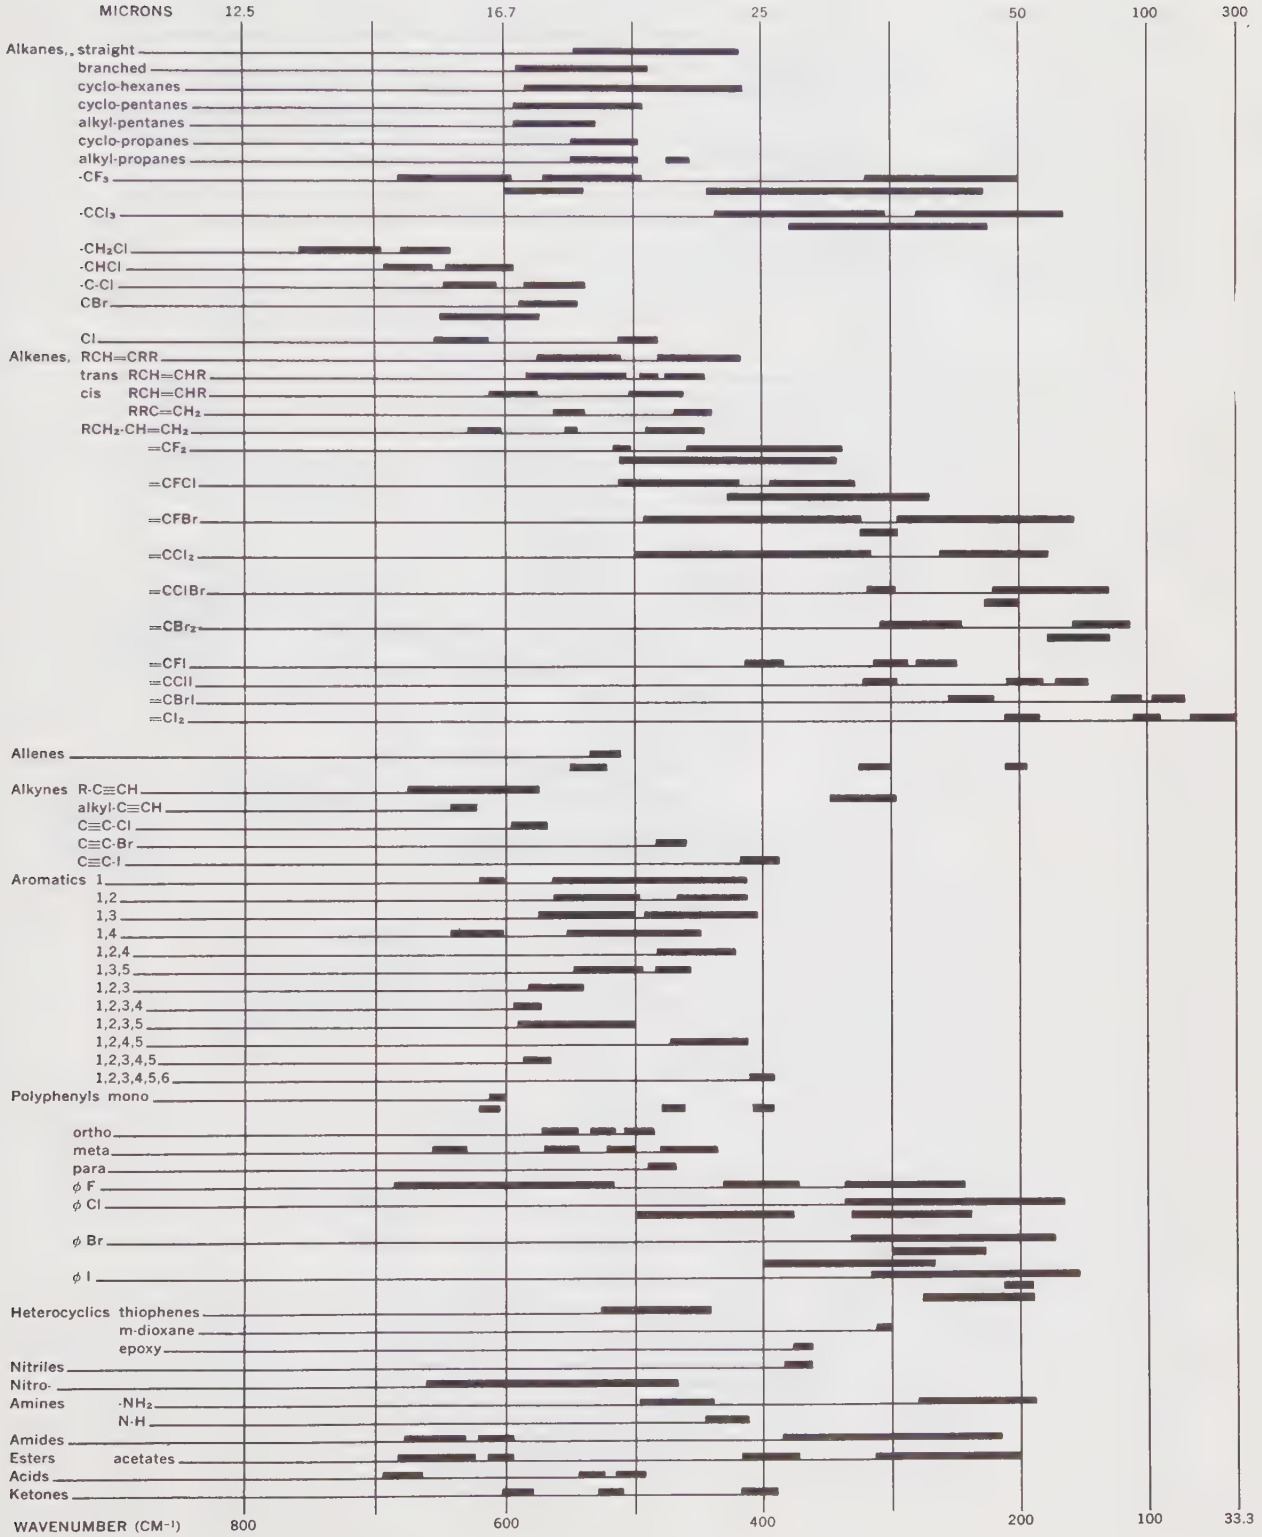
INFRARED CORRELATION CHART No. 4

Prepared from information supplied by Beckman Instruments



This chart presents some correlations between structure and single-bond vibrations for a number of classes of compounds having absorption between 1500-650 cm^{-1}.

INFRARED CORRELATION CHART No. 4 (Con't.)



Prepared from information supplied by Beckman Instruments

This chart presents some correlations between structure and single-bond vibrations for a number of classes of compounds having absorption between 1500-650 cm^{-1}.

FAR INFRARED VIBRATIONAL FREQUENCY CORRELATION CHART

Based on evidence compiled by James E. Stewart of Beckman Instruments.
This chart shows the vibrational frequency correlation in the far infrared region.
Because research is continuing in the far infrared region, this chart is not all-inclusive.

FAR INFRARED VIBRATIONAL FREQUENCY CORRELATION CHART (Con't.)

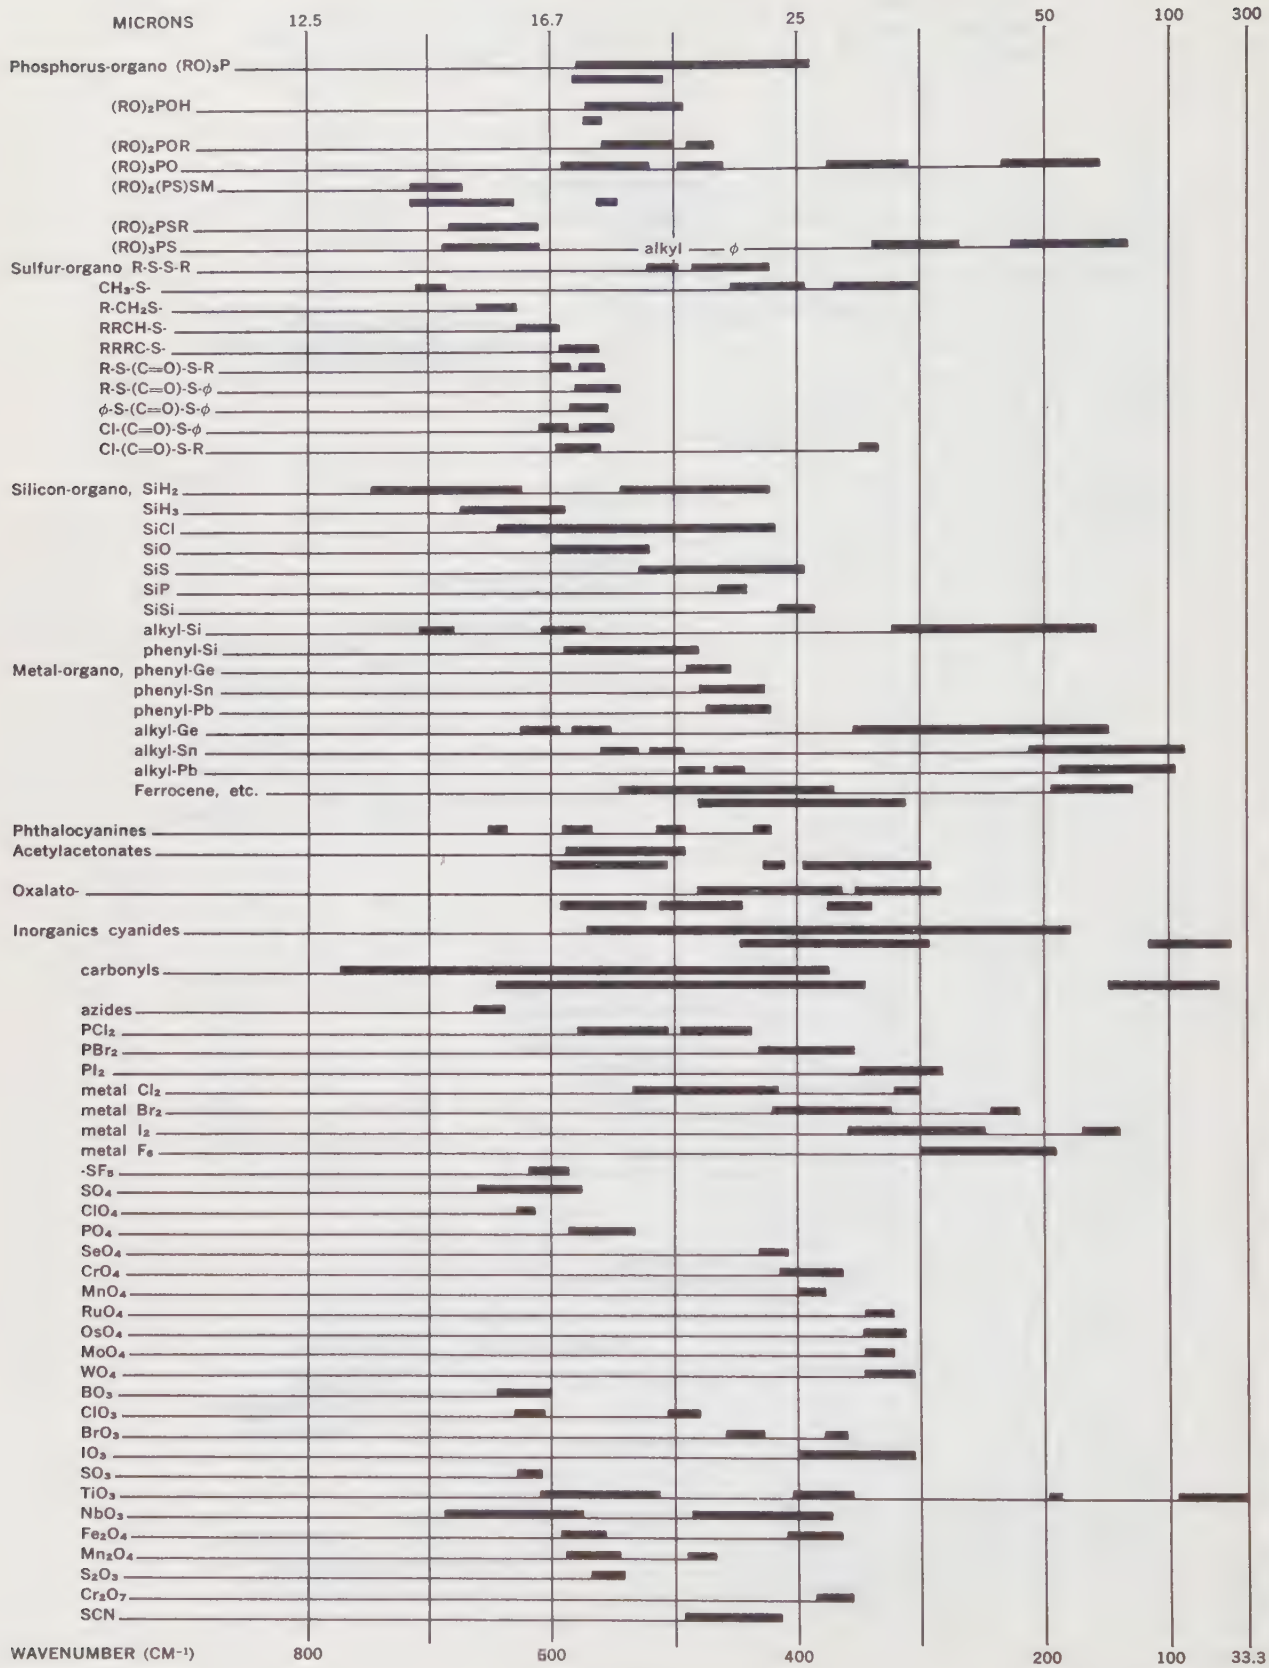


CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ~700–300 cm^{-1}

Freeman F. Bentley, Lee D. Smithson, and Adele L. Rozek

This chart summarizes the characteristic frequencies known to occur between approximately 700–300^{-1}. Those who anticipate using this region of the spectrum should consult "Infrared Spectra and Characteristic Frequencies between ~700–300 cm^{-1}" by Interscience Publishers, a division of John Wiley and Sons, Inc. for a complete discussion of the characteristic frequencies summarized in this chart, a large collection of infrared spectra (700–300 cm^{-1}) of most of the common organic and inorganic compounds, and an extensive bibliography of references to infrared data below ~700 cm^{-1}.

In this chart the black horizontal bars indicate the range of the spectrum in which the characteristic frequencies have been observed to occur in the compounds investigated. The number of compounds investigated is given immediately to the right of the names or structures of the compounds. Obviously those characteristic frequency ranges based upon a limited number of compounds should be used with caution.

The letters above the bars indicate the relative intensities of the absorption bands. These intensities are based upon the strongest band in the spectra (700–300 cm^{-1}) of specific classes of compounds investigated, and they cannot be compared accurately with the intensities given for other classes.

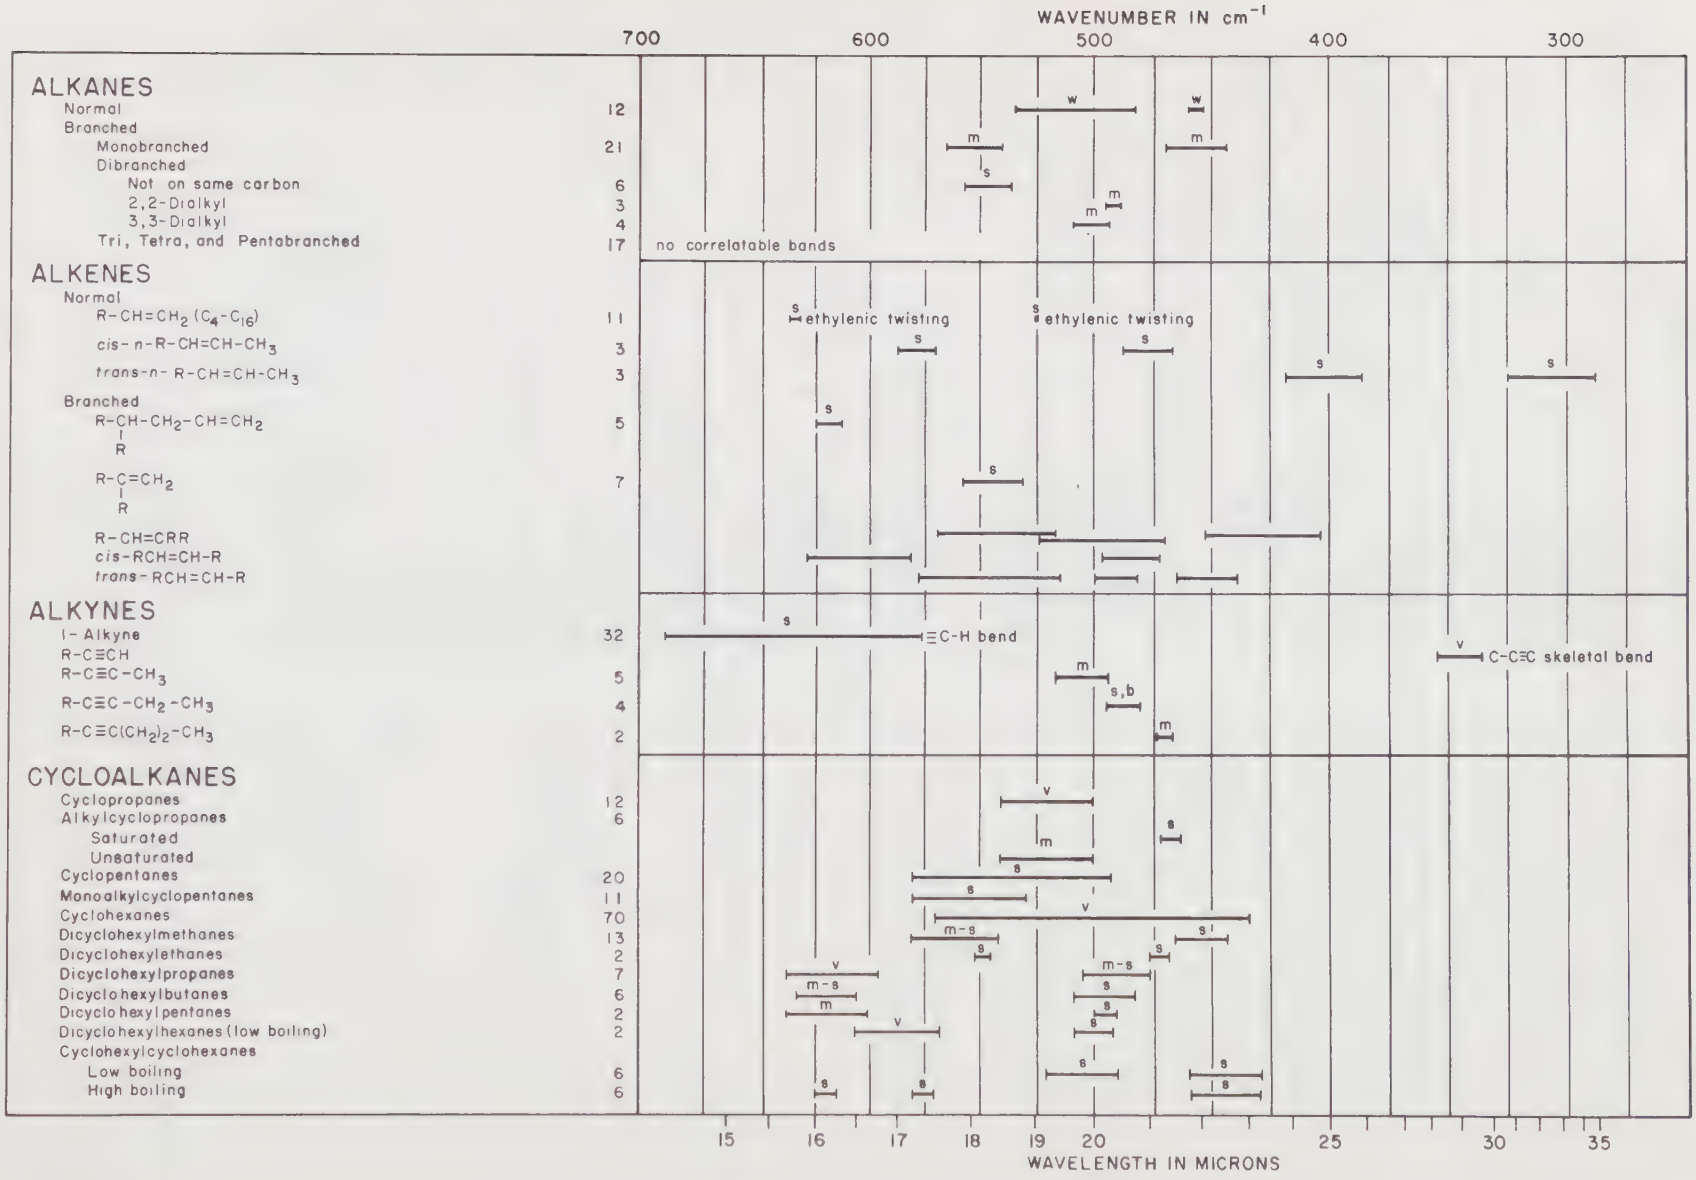
When known, the specific vibration giving rise to the characteristic frequency is printed in abbreviated form immediately to the right of the bar indicating the frequency range except when lack of space prevents this. When there can be no ambiguity, this information may be printed other than to the right. In doubtful cases, arrows are used for clarification.

Naturally, the characteristic frequencies vary in their specificity and analytical value. The user is, therefore, cautioned to use this chart with some reserve. After reviewing this chart, the reader should be aware that there are many characteristic frequencies in the 700–300 cm^{-1} region. Used cautiously, this chart can be of considerable value in the elucidation of structures of unknown compounds.

It is important to emphasize that the region of the infrared between ~700–300 cm^{-1} should be used in conjunction with the more conventional 5000–700 cm^{-1} region. Much of the value of the 700–300 cm^{-1} region can only be realized after interpreting the spectrum between 5000–700 cm^{-1}.

The following symbols and abbreviations are used:

Symbol or Abbreviation	Definition
αCCC	In-plane bending of benzene ring
Antisym.	Antisymmetrical (Asymmetrical)
$\sim$	Approximately
β	In-plane bending of ring substituent bond
δ	In-plane bending
γ	Out-of-plane bending
i.p.	In-plane
m	Medium
ν	Stretching
ν_s	Symmetrical stretching
ν_{as}	Antisymmetrical stretching
o.p.	Out-of-plane
$\parallel$	Parallel
$\perp$	Perpendicular
ϕ	Phenyl
ϕCC	Out-of-plane bending of aromatic ring
r	Rocking
s	Strong
sh	Shoulder
Sym.	Symmetrical
v	Variable
w	Weak
"X" Sensitive	An aromatic vibrational mode whose frequency position is greatly dependent on the nature of the substituent.



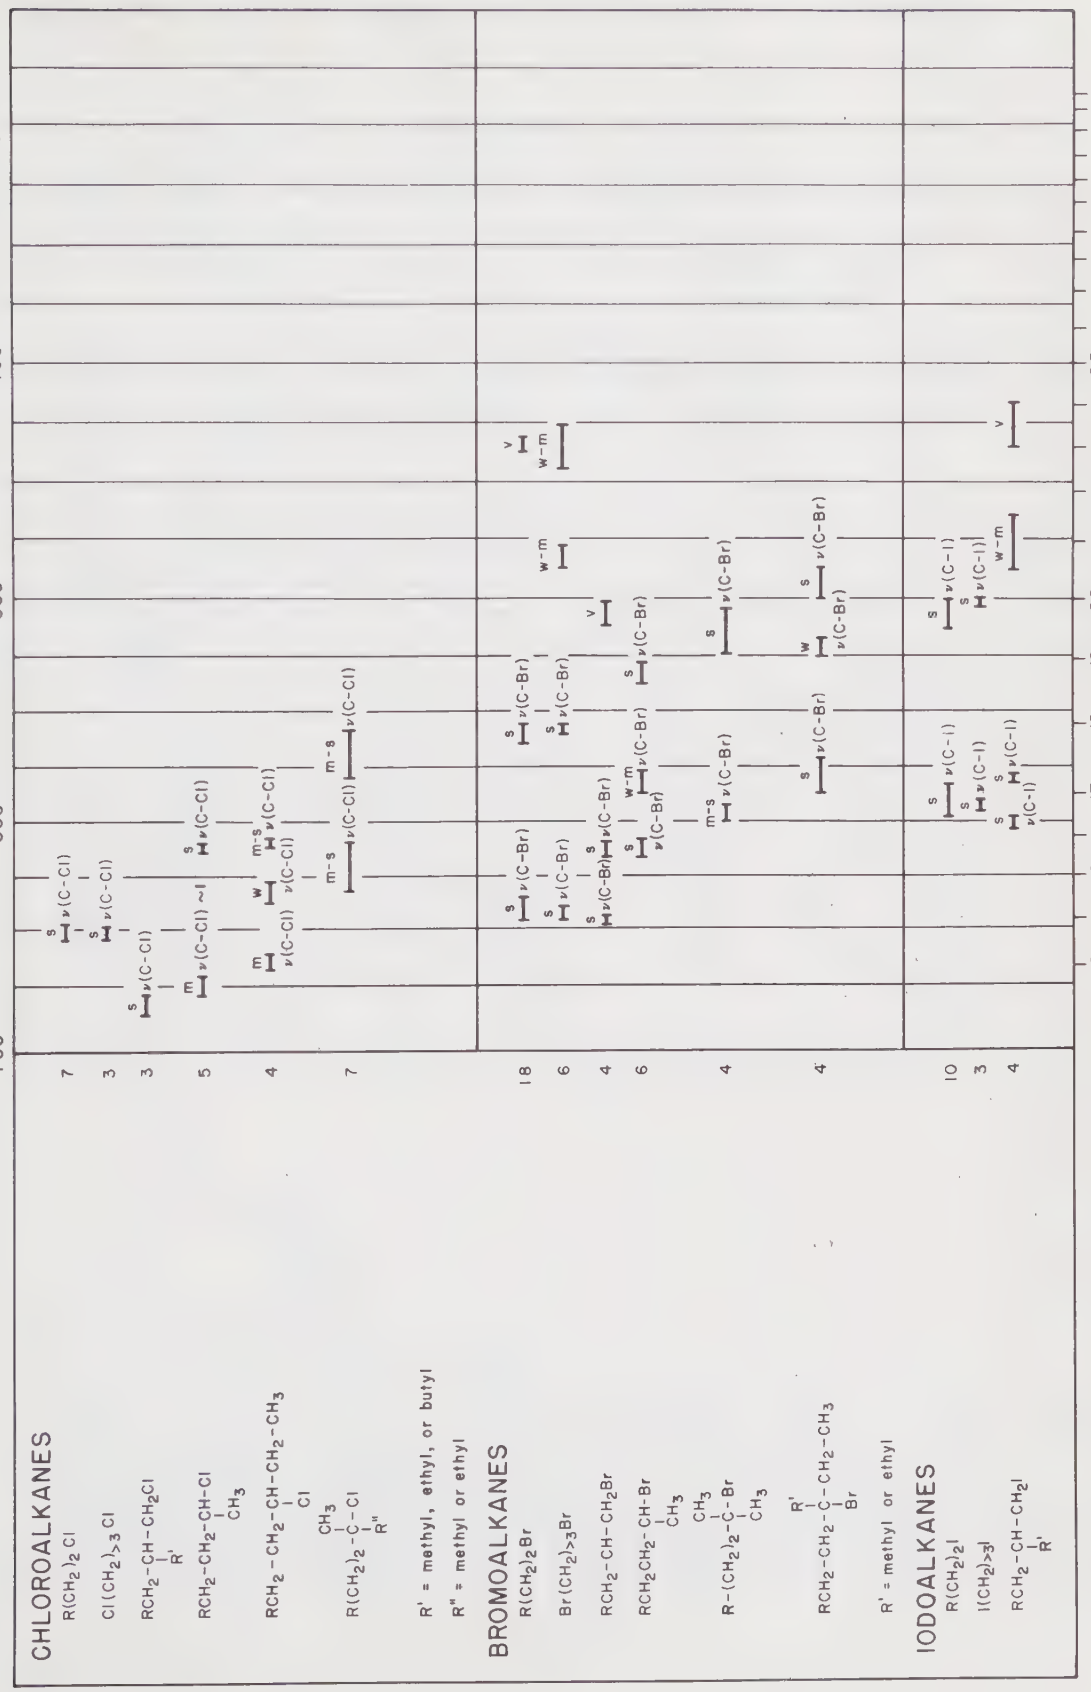


CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ~ 700–300 cm^{-1}

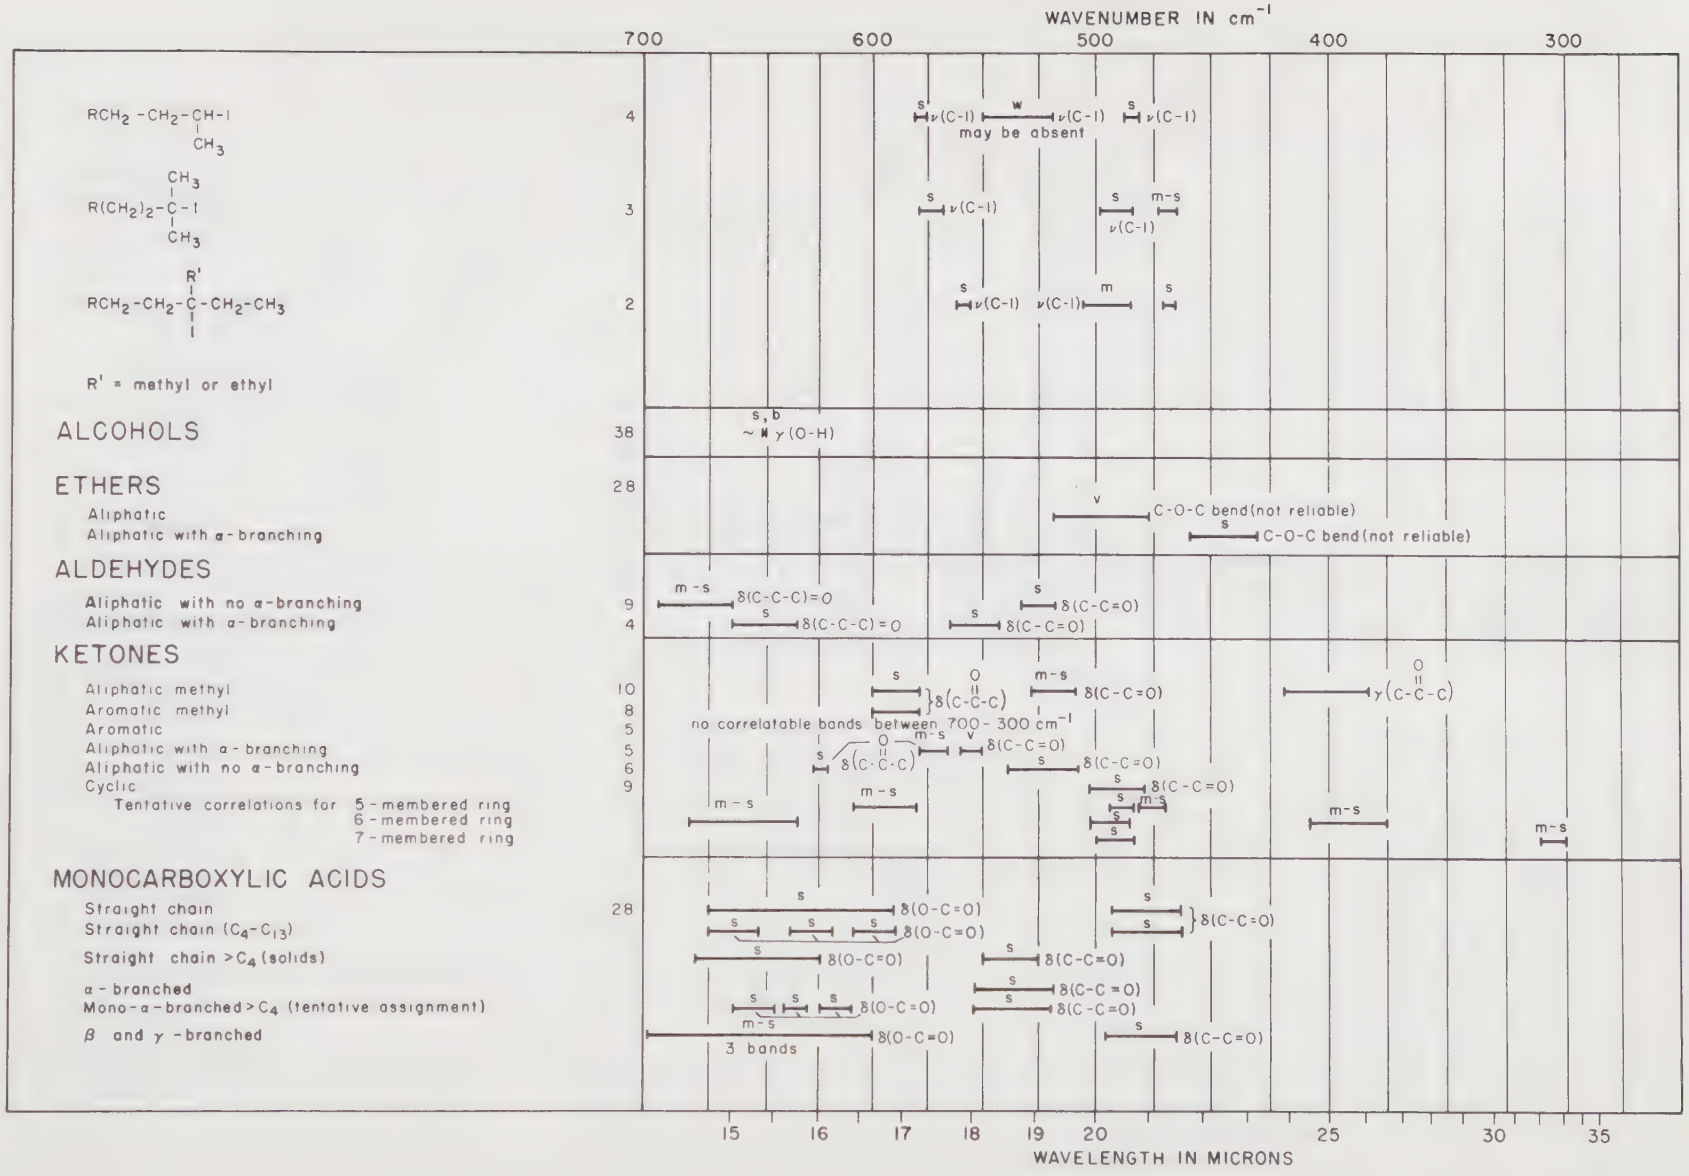
CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ~ 700–300 cm^{-1}



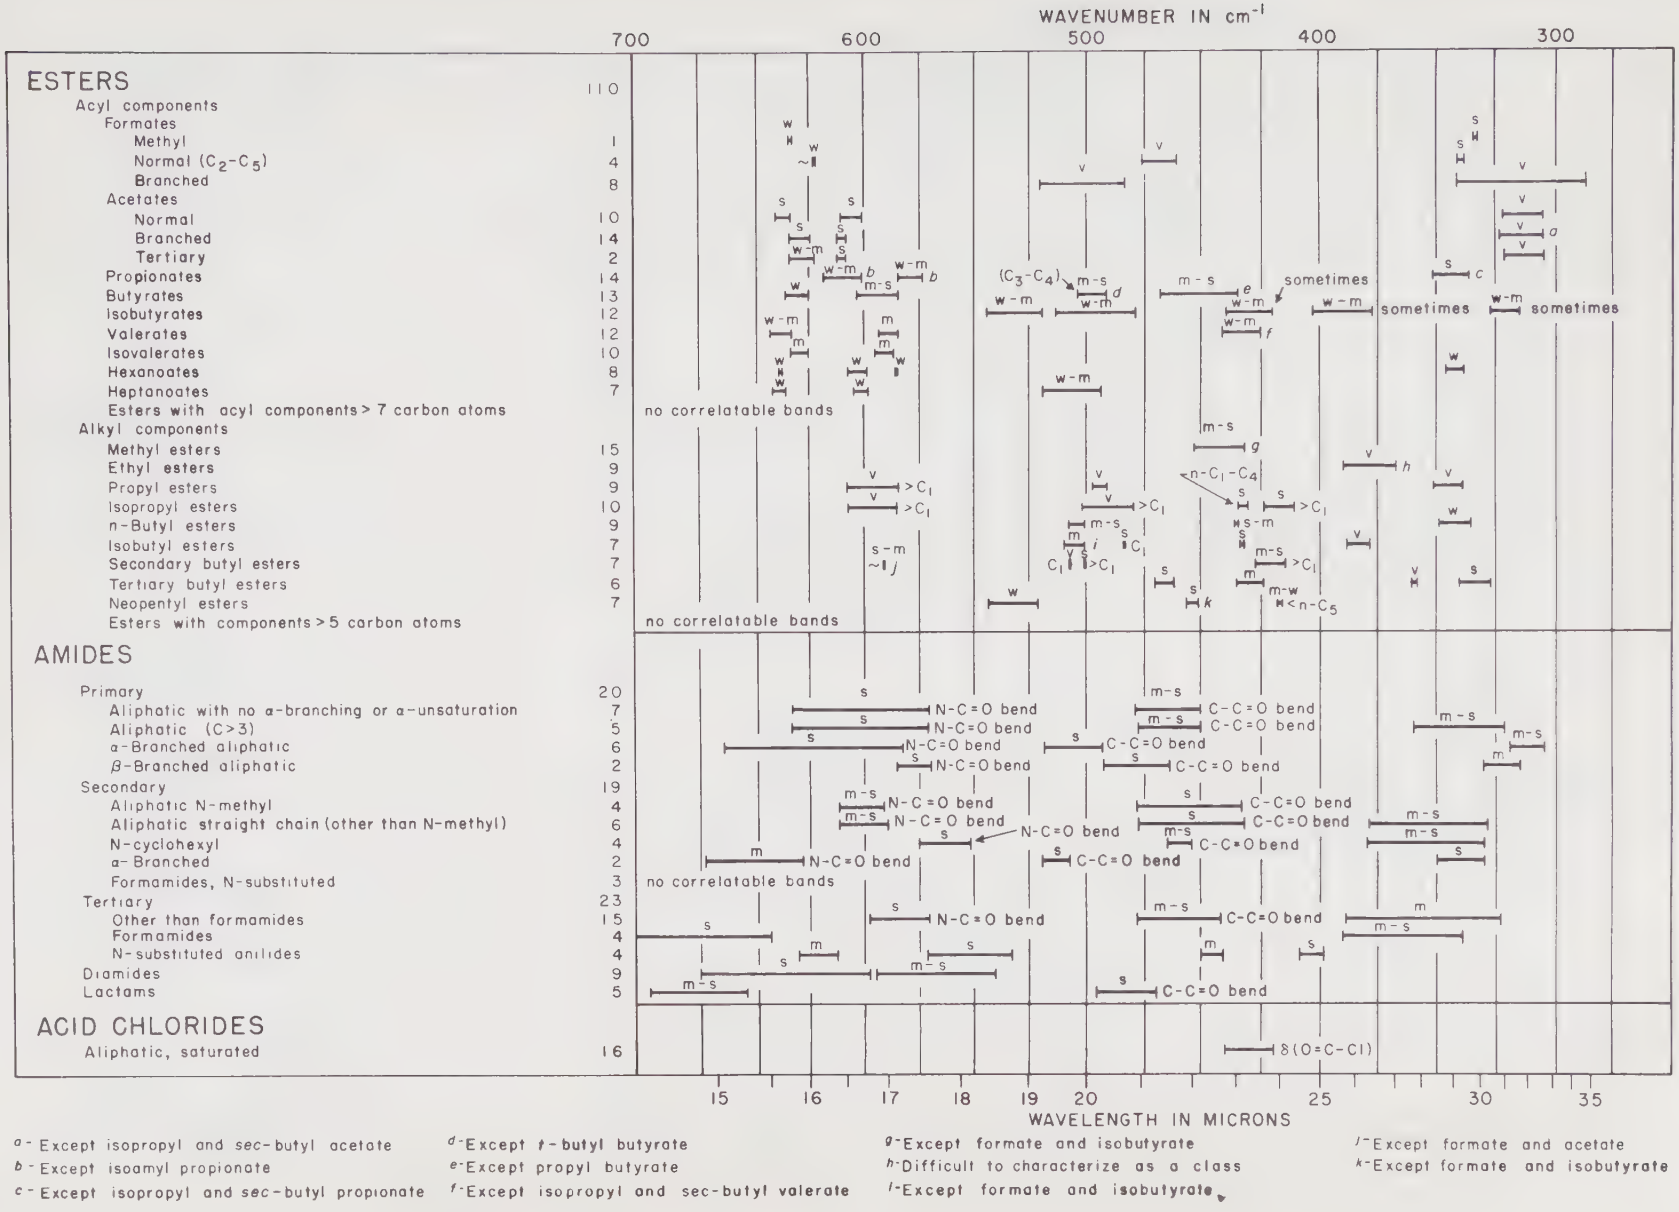


CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ~ 700-300 cm^{-1}

a - Except isopropyl and sec-butyl acetate
b - Except isoamyl propionate
c - Except isopropyl and sec-butyl propionate
d - Except t-butyl butyrate
e - Except propyl butyrate
f - Except isopropyl and sec-butyl valerate
g - Except formate and isobutyrate
h - Difficult to characterize as a class
i - Except formate and isobutyrate
j - Except formate and acetate
k - Except formate and isobutyrate

CHARACTERISTIC NMR SPECTRAL POSITIONS FOR HYDROGEN IN ORGANIC STRUCTURES

By permission from Erno Mohacsi, J. of Chemical Education, 41, 38 (1964)

This table is useful for quick qualitative determination of proton spectrum lines by providing a tabulation of line positions obtained using tetramethylsilane as an internal reference. The listing has been kept as simple as possible for this purpose. The proton spectrum lines are arranged according to the chemical shift relative to tetramethylsilane and are given in values of τ and σ. The purpose of this table is to supplement tables available in standard references and to summarize information available in the literature.

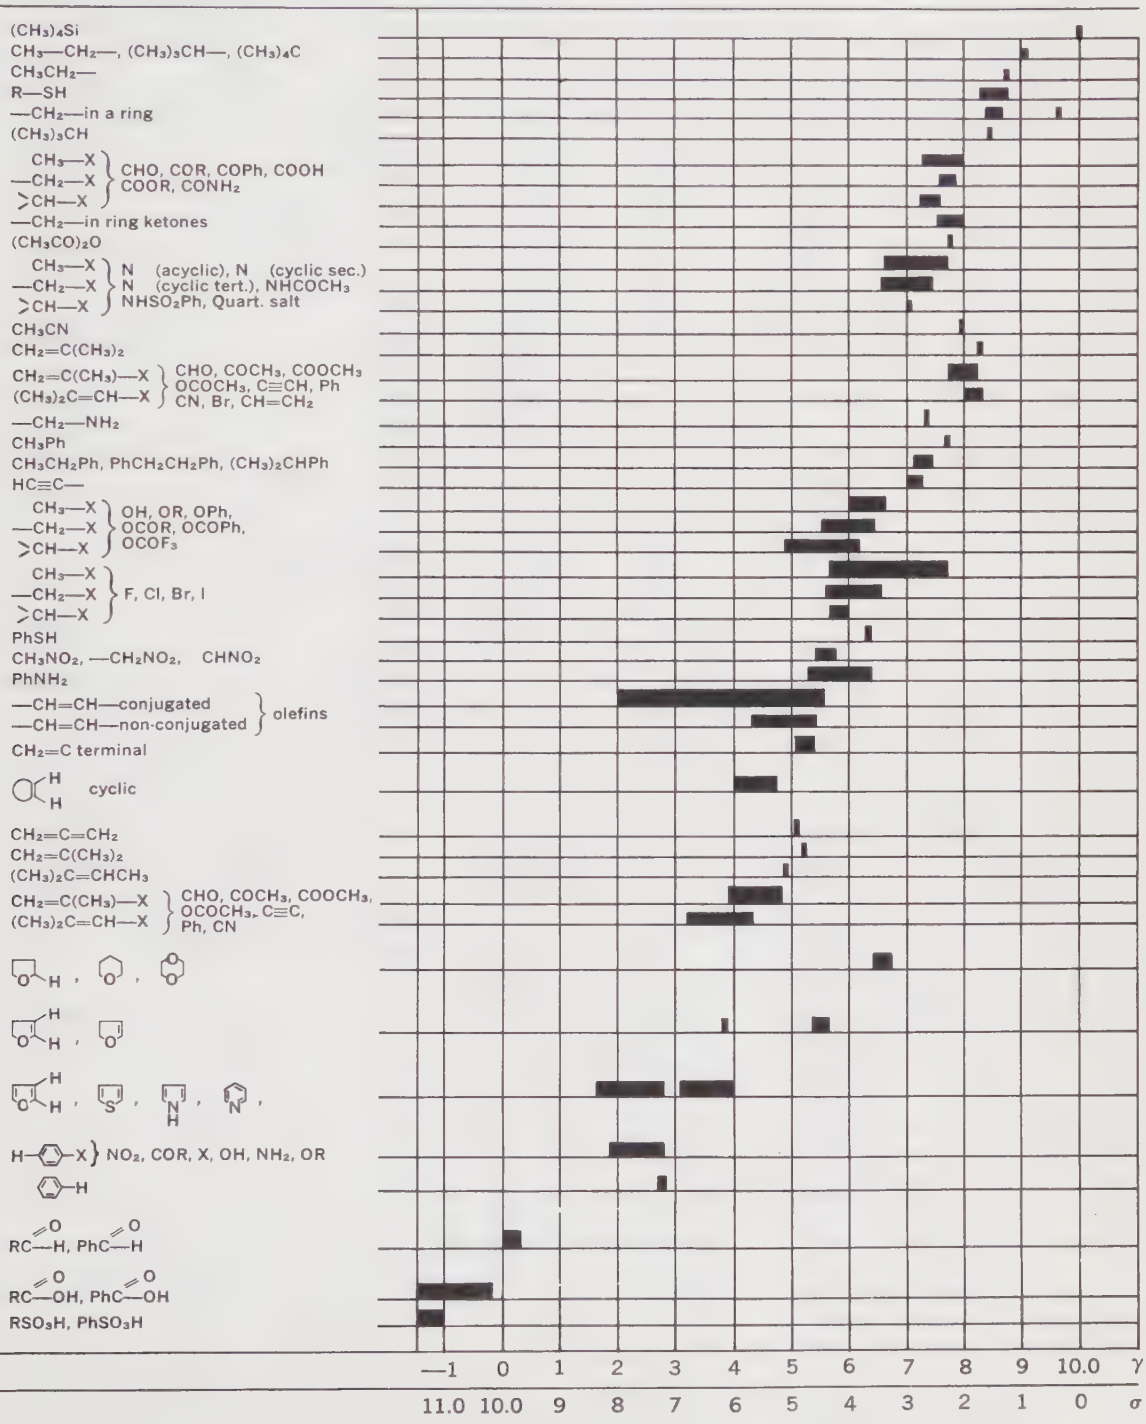

Table S: STABLE PARTICLES. January, 1968.

From *Data on Particles and Resonant States* · REVIEW OF MODERN PHYSICS · JANUARY 1968

A. H. Rosenfeld, N. Barash-Schmidt, A. Barbaro-Galtieri, L. R. Price, Matts Roos, Paul Söding, W. J. Willis, C. G. Wohl

[a] Based mainly on E. R. Cohen and J. W. M. DuMond, Rev. Mod. Phys. 37, 537 (1965).

Note that there are some disagreements with the results of recent experiments.

CP violation parameters

$|\eta_{+-}| = (1.89\pm0.09)\times10^{-3}$

$\Phi_{+-} = (65\pm11)^\circ$ S=1.1*

$|\eta_{00}|$ still uncertain, see data listings

Decay Parameters †

	Measured: α	Measured: Φ(degree)	Derived: γ	Derived: Δ(degree)
Magnetic Moment $((e\hbar/2m_p c))$				
2.5 ±.7	-.955±0.070 S=1.1*			
	+.017±0.037	(180±30)°	-0.99	(0±85)°
	-.06 ±0.05	(22±30)°	0.90	
	S=1.6*			
	For $\Sigma^- \to \Lambda e\nu$, $\frac{g_V}{g_A} = 0.3\pm0.3$ †			
	-.33 ±0.10			
	-.402±.051 S=1.4*	(6±8)° S=1.3*		

For $\Lambda \to pe\nu$, $\frac{g_A}{g_V} = -1.14^{+0.23}_{-0.33}$ †

$\frac{g_A}{g_V} = -1.1^{35}_{36}$

† The definition of these quantities is as follows:

$$\alpha = \frac{2\,\mathrm{Re}(S^*P)}{|S|^2+|P|^2};\quad \beta = \frac{2\,\mathrm{Im}(S^*P)}{|S|^2+|P|^2};\quad \gamma = \frac{|S|^2-|P|^2}{|S|^2+|P|^2}$$

$\tan\Phi = \beta/\gamma$ $\quad \tan\Delta = -\beta/\alpha$

g_A/g_V defined by $M \propto \langle B_f | V_\lambda (g_V - g_A\gamma_5) | B_i \rangle$

* S = Scale factor = $\sqrt{\chi^2/(N-1)}$ where N = number of experiments. S should be ≈ 1. If S > 1, we have enlarged the error of the mean, δx, i.e., δx→S δx. This new convention is still inadequate, since if S > 1, the real uncertainty is probably even greater than Sδx. See text of January 1967 edition.

† In decays with more than two bodies, P_{max} is the maximum momentum that any particle can have.

b. Theoretical value, see also data card listings.

d. See note in data card listings.

* Quoted error includes scale factor S = $\sqrt{\chi^2/(N-1)}$. See footnote to Table S.

† Square brackets indicate a subreaction of the previous (unbracketed) decay mode.

(a) ΓM is the half-width of the resonance when plotted against M^2.

(b) For decay modes into ≥ 3 particles p_{max} is the maximum momentum that any of the particles in the final state can have. The momenta have been calculated using the averaged central mass values, without taking into account the widths of the resonances.

ABBREVIATIONS AND SYMBOLS

Abbreviations

The following list of abbreviations is intended to cover those in common use in chemistry and physics. Symbols are presented in a separate list following the abbreviations.

A.	Acre
Å	Ångström unit
a	Are
a.	Acid
abs.	Absolute
abt.	About
a.c.	Alternating current
acet.	Acetone
acet. a.	Acetic acid
al.	Alcohol
alk.	Alkali
alt.	Altitude
amal.	Amalgam; amalgamated
amor. *or* amorph.	Amorphous
amp.	Ampere
anh.	Anhydrous
antilog	Antilogarithm
ap.	Apothecaries'
appr.	Approximately
aq.	Aqua; aqueous; water
aq. reg.	Aqua regia
asym.	Asymmetrical
atm. *or* atmos.	Atmosphere (atmospheric)
At. No.	Atomic number
At. Wt.	Atomic weight
aux.	Auxiliary
Av.	Average
av. *or* avoir.	Avoirdupois
bar.	Barometer
bbl.	Barrel
bd.	Board
Bé	Beaumé (degrees)
B.G.	Birmingham gauge (hoop and sheet)
b.h.p.	Brake horse power
bl.	Blue
blk.	Black
B.M.	Board measure
b.p.	Boiling point
br.	Brown
BTU	British thermal unit
bu.	Bushel
B.W.G.	Birmingham wire gauge
bz.	Benzene
C	Centigrade
c	Carat; centi-
c.	Cold
ca	Candle
ca.	*Circa*, about; approximately
cal.	Calorie (gram)
cc. *or* c.c.	Cubic centimeter
cd.	Cord
c. cm	Cubic centimeter
Cent.	Centigrade
centi-	Prefix meaning 1/100
cf.	*Confer*, compare
c.f.m.	Cubic foot per minute
cgs	Centimeter-gram-second system of units
cgse	Cgs electrostatic system
cgsm	Cgs electromagnetic system
ch.	Chain
chl.	Chloroform
cir.	Circular
circum.	Cirumference
cl	Centiliter
cm	Centimeter
cm^2	Square centimeter
cm^3	Cubic centimeter
c.m.	Circular mil
coef.	Coefficient
colog	Cologarithm
colorl.	Colorless
comm'l	Commercial
conc.	Concentrated
cond.	Condensing
const.	Constant
cos	Cosine
$\cos^{-1}$	Arc or angle whose cosine is . . .; anti-cosine of; inverse cosine of
cosec	Cosecant
cosh	Hyperbolic cosine
$\cosh^{-1}$	Inverse hyperbolic cosine
cot	Cotangent
$\cot^{-1}$	Arc or angle whose cotangent is . . .
coth	Hyperbolic cotangent
$\coth^{-1}$	Inverse hyperbolic cotangent
covers	Coversed sine
c.p.	Candle power; circular pitch; center of pressure
cry. *or* cryst.	Crystalline; crystals
csc	Cosecant
$\csc^{-1}$	Arc or angle whose cosecant is . . .
csch	Hyperbolic cosecant
csch^{-1}	Inverse hyperbolic cosecant
CTU	Centigrade thermal unit
cu.	Cubic
cu. cm	Cubic centimeter
cu. ft.	Cubic foot
cu. in.	Cubic inch
cu. m	Cubic meter
cu. yd.	Cubic yard
cwt.	Hundredweight
cyl.	Cylinder
d	Derivative; deci-
d.	Decomposes; day
d.	Dextrorotary
d.c.	Direct current
dec.	Decomposes
deci-	Prefix meaning 1/10
def.	Definition (s)
deg	Thermometric degree; absolute C unless contrary is indicated
deka-	Prefix meaning 10
deliq.	Deliquescent
den. *or* dens.	Density
dg	Decigram
diam.	Diameter
dil.	Dilute
dissd.	Dissolved
dk	Deka-
dk.	Dark
dkg.	Dekagram.
dkl	Dekaliter
dkm	Dekameter
dkm^2	Square dekameter
dkm^3	Cubic dekameter
dks	Dekastere
dl	Deciliter
dm	Decimeter
dm^2	Square decimeter
dm^3	Cubic decimeter
d.p.	Diametral pitch; double pole
dr.	Dram
dr. ap. *or* ℥ ap.	Dram, apothecaries'
dr. av. *or* ℥ av.	Dram, avoirdupois
dr. fl. *or* ℥ fl.	Dram, fluid
dr. t. *or* ℥t.	Dram, troy
ds	Decistere
dwt.	Pennyweight
efflor.	Efflorescent
e.g.	*Exempli gratia*, for example
e.h.p.	Effective horse power
E.L.	Elastic limit
em	Cgsm unit of quantity of electricity
emf *or* e.m.f.	Electromotive force
es	Electrostatic or cgse unit of quantity of electricity
etc.	*Et. cetera*, and so forth
eth.	Ether
eth. acet.	Ethyl acetate
et. seq.	*Et sequentes*, and the following
evap.	Evaporation
ex.	Excess
exp	Exponential function
exp.	Explodes
exsec	Exterior secant
F	Fahrenheit
f.	From
fahr.	Fahrenheit
fath.	Fathom
feath.	Feathery
f.h.p.	Friction horse power
fir.	Firkin
fl.	Fluid
fl. dr.	Dram, fluid
fl. oz.	Ounce, fluid
fluores.	Fluorescent
fps	Foot-pound-second system of units
fpse	Foot-pound-second electrostatic system
fpsm	Foot-pound-second electromagnetic system
F.S.	Factor of safety
ft.	Foot
$ft.^2$	Square foot
$ft.^3$	Cubic foot
ft.-lb.	Foot-pound
fur.	Furlong
G	Gravitation constant
g	Gram
g-cal. *or* g.-cal.	Gram calorie
gal.	Gallon
gel.	Gelatinous
gi.	Gill
glac.	Glacial
glit.	Glittering
glyc.	Glycerine
gm.	Gram
gr.	Gray; grain
grn.	Green
gyr.	Gyration
h	Hecto-
h.	Hot; hour
ha	Hectare
hecto-	Prefix meaning 100
hex.	Hexagonal
hg	Hectogram
hhd.	Hogshead
hl	Hectoliter
hm	Hectometer
hm^2	Square hectometer
hm^3	Cubic hectometer
hor. *or* horiz.	Horizontal
h.-p.	High-Pressure
HP *or* h.p.	Horse power
h.p.-hr.	Horse power-hour
hr.	Hour
hyg.	Hygroscopic
i.	Insoluble
ibid.	*Ibidem*, in the same place
i.e.	*Id est*, that is
ign.	Ignites
i.h.p.	Indicated horse power
in.	Indigo; inch
$in.^2$	Square inch
$in.^3$	Cubic inch
inc.	Inclusive
in.-lb.	Inch-pound
insol.	Insoluble
Int.	International
iso.	Isotropic
isom.	Isometric
isoth.	Isothermal
k	Kilo-
kg	Kilogram
kg-cal.	Kilogram-calorie
kg-m	Kilogram-meter
kilo-	Prefix meaning 1,000
kl	Kiloliter
km	Kilometer
km^2	Square kilometer
km^3	Cubic kilometer
kva.	Kilovolt-ampere
kw.	Kilowatt
kw.-hr.	Kilowatt-hour
l	Liter
l.	Long
l	Laevorotary
lat.	Latitude
lb.	Pound
lb. ap.	Pound, apothecaries'
lb. av.	Pound, avoirdupois
lb. t.	Pound, troy
leaf.	Leaflets
lgr.	Ligroin
li.	Link
lin.	Linear
liq.	Liquid
lim.	Limit
ln	Natural hyperbolic or Napierian logarithm
log *or* log.	Logarithm
$\log_e$	Logarithm to the base *e*; natural, hyperbolic or Napierian logarithm
$\log_{10}$	Common logarithm; logarithm to the base 10
long.	Longitude
lng.	Long
l.-p.	Low-pressure
lt.	Light
lust.	Lustrous
mg	Minim or drop
m	Meter; milli-
m^2	Square meter
m^3	Cubic meter
m.	Minute
m.	Meta-
max.	Maximum
med.	Medium
meth.	Methyl
meth. al.	Methyl alcohol
m.e.p.	Mean effective pressure
met.	Metallic
mg	Milligram
m.h.c.p.	Mean horizontal candle power
mi.	Mile
mic.	Microscopic
micro-	Prefix meaning 1/1,000,000 or 10^{-6}
micro-micro	Prefix meaning 10^{-12}
milli-	Prefix meaning 1/1,000
milli-micro-	Prefix meaning 10^{-9}
min *or* min.	Minute
min.	Minim; minimum; mineral
ml	Milliliter
m.l.h. c.p.	Mean lower hemispherical candle power
mm	Millimeter
mm^2	Square millimeter
mm^3	Cubic millimeter
mmf *or* m.m.f.	Magnetomotive force
mol.	Molecule
Mol. Wt.	Molecular weight
monocl.	Monoclinic
m.p.	Melting point
m.s.c.p.	Mean spherical candle power
myria-	Prefix meaning 10,000 or 10^4
$m\mu$	Millimicron; millimicro-
N	Numeric; number (in mathematical tables)
n.	Normal
n	Refractive index
need.	Needles
o	Ortho-
Obs.	Observer
octahdr.	Octahedral
oil turp.	Oil of turpentine
or.	Orange
oz.	Ounce
oz. ap. *or* ℥ ap.	Ounce, apothecaries'
oz. av. *or* ℥ av.	Ounce, avoirdupois
oz. fl. *or* ℥ fl.	Ounce, fluid
oz. t. *or* ℥ t.	Ounce, troy
p	Para-
pa.	Pale
p. ct.	Per cent
perp.	Perpendicular
p.f.	Power factor
pk.	Peck
pl.	Plates
powd.	Powder
pr.	Prisms
precip. *or* p'p't'd	Precipitated
p. sol.	Partly soluble
pt.	Point; pint
purp.	Purple
pyr.	Pyridine
Q	Quantity
q	Quintal
qt.	Quart
q.v.	*Quod vide*, which see
R	Réaumur; radioactive mineral
rac	Racemic
rad	Radian, measure of angle
rad.	Radius
rd.	Rod
reg.	Regular
rev.	Revolution
rhbdr.	Rhombohedral
rhomb.	Rhombic or orthorhombic
R.M.S.	Square root of mean square
r.p.m.	Revolutions per minute
s	Stere
s.	Scruple; soluble; second
s. ap. *or* ℈	Scruple, apothecaries'
sat. *or* sc.	Saturated
sat'd	
S.E.	Scales
sec *or* sec.	Siemens unit
	Second (mean solar unless contrary is stated)
sec	Secant
$\sec^{-1}$	Arc or angle whose secant is . . .
sech	Hyperbolic secant
sech^{-1}	Inverse hyperbolic secant
segm.	Segment
sh.	Short
sin	Sine
$\sin^{-1}$	Arc or angle whose sine is . . .
sinh	Hyperbolic sine
$\sinh^{-1}$	Inverse hyperbolic sine
sl.	Slightly
sm.	Small
sol.	Solution; soluble
soln.	Solution
sp.	Specific
specif.	Specification
sp. gr.	Specific gravity
sq.	Square
sq. ch.	Square chain
sq. ft.	Square foot
sq. in.	Square inch
sq. mi.	Square mile
sq. rd.	Square rod
sq. yd.	Square yard
std.	Standard
subl.	Sublimes
sym.	Symmetrical
t	Metric ton
t.	Troy
tab. *or* tabl.	Tablets
tan	Tangent
$\tan^{-1}$	Arc or angle whose tangent is . . .
tanh	Hyperbolic tangent
$\tanh^{-1}$	Inverse hyperbolic tangent
temp.	Temperature
tetr. *or* tetrag.	Tetragonal
tn.	Ton
tr.	Transition
tricl.	Triclinic
trig.	Trigonal
trim.	Trimetric
T.S.	Tensile strength
turp.	Turpentine
Tw.°	Degrees Twaddell, hydrometer scale
ult.	Ultimate
uns.	Unsymmetrical
U.S.	United States of America; universal system of lens apertures
v.	Very
v.	*Vide*, see
vel. *or* veloc.	Velocity
vers	Versed sine
vert	Vertical
visc.	Viscous
vol.	Volume
volt.	Volatilizes
w.	Water
wh.	White
wt.	Weight
yd.	Yard
yel.	Yellow
yr.	Year
μ	Micron; micro-
$\mu\mu$	Micromicron; micromicro-

SPELLING AND SYMBOLS FOR UNITS

From "Units of Weight and Measure"
L. B. Chisholm, National Bureau of Standards
Miscellaneous Publication 286 (May, 1967)

The spelling of the names of units as adopted by the National Bureau of Standards is that given in the list below. The spelling of the metric units is in accordance with that given in the law of July 28, 1866, legalizing the Metric System in the United States.

Following the name of each unit in the list below is given the symbol that the Bureau has adopted. Attention is particularly called to the following principles:

1. No period is used with symbols for units. Whenever "in" for inch might be confused with the preposition "in", "inch" should be spelled out.

2. The exponents "^{2}" and "^{3}" are used to signify "square" and "cubic," respectively, instead of the symbols "sq" or "cu," which are, however, frequently used in technical literature for the U. S. Customary units.

3. The same symbol is used for both singular and plural.

Some Units and Their Symbols

Unit	Symbol	Unit	Symbol	Unit	Symbol
acre	acre	fathom	fath	millimeter	mm
are	a	foot	ft	minim	minim
barrel	bbl	furlong	furlong	ounce	oz
board foot	fbm	gallon	gal	ounce, avoirdupois	oz avdp
bushel	bu	grain	grain	ounce, liquid	liq oz
carat	c	gram	g	ounce, troy	oz tr
Celsius, degree	°C	hectare	ha	peck	peck

				yard	yd

SYMBOLS, UNITS AND NOMENCLATURE IN PHYSICS

From Document U.I.P. 11 (S.U.N. 65–3)
International Union of Pure and Applied Physics
Used by permission of the Secretary

1. PHYSICAL QUANTITIES—GENERAL RECOMMENDATIONS.

1.1 The symbol for a ***physical quantity*** (french: 'grandeur physique', german: 'physikalische Grösse', american sometimes: 'physical magnitude') is equivalent to the product of the *numerical value* (or the measure), a pure number, and a *unit*, i.e.

$$\text{physical quantity} = \text{numerical value} \times \text{unit}.$$

For dimensionless physical quantities the unit often has no name or symbol and is not explicitly indicated.

Examples: $E = 200$ erg $\qquad n = 1.55$ (for quartz)
$F = 27$ N $\qquad \nu = 3 \times 10^8\ \mathrm{s}^{-1}$

1.2 Symbols for physical quantities—General rules.

1. *Symbols for physical quantities* should be *single letters* of the latin or greek alphabet with or without modifying signs: subscripts, superscripts, dashes, etc.

   Remark:

   a. An exception to this rule consists of the two letter symbols, which are sometimes used to represent dimensionless combinations of physical quantities. If such a symbol, composed of two letters, appears as a factor in a product, it is recommended to separate this symbol from the other symbols by a dot or by brackets or by a space.
   b. Abbreviations, i.e. shortened forms of names or expressions, such as p.f. for partition function, should not be used in physical equations. These abbreviations in the text should be written in ordinary roman type.

2. *Symbols for physical quantities* should be printed in *italic* (or *sloping*) *type.*

   Remark:

   It is recommended to consider as a guiding principle for the printing of indices the criterion: only indices which are symbols for physical quantities should be printed in italic (sloping) type. *Examples:*

Upright indices:	*Sloping indices:*
C_{g} (g = gas)	p in C_p
g_{n} (n = normal)	n in $\Sigma_n a_n \varphi_n$
μ_{r} (r = relative)	x in $\Sigma_x a_x b_x$
E_{k} (k = kinetic)	i, k in g_{ik}
χ_{e} (e = electric)	x in p_x

3. *Symbols for vectors and tensors:* To avoid the usage of subscripts it is often convenient to indicate vectors and tensors of the second rank by letters of a special type. The following choice is recommended:
   a. Vectors should be printed in bold type, by preference bold italic (sloping) type, e.g. $\boldsymbol{A}$, $\boldsymbol{a}$.
   b. Tensors of the second rank should be printed in bold face sans serif type, e.g. S, T.

   Remark:

   When this is not available, vectors may be indicated by an arrow and tensors by a double arrow on top of the symbol.

1.3 Simple mathematical operations.

1. *Addition and subtraction* of two physical quantities are indicated by:

$$a + b \qquad \text{and} \qquad a - b$$

2. *Multiplication* of two physical quantities may be indicated in one of the following ways:

$$ab \qquad a\ b \qquad a\,.\,b \qquad a \cdot b \qquad a \times b$$

Remark: The various products of vectors and tensors may be written in the following ways:

scalar product of vectors $\boldsymbol{A}$ and $\boldsymbol{B}$:	$\boldsymbol{A}\,.\,\boldsymbol{B}$	$\boldsymbol{A} \cdot \boldsymbol{B}$
vector product of vectors $\boldsymbol{A}$ and $\boldsymbol{B}$:	$\boldsymbol{A} \wedge \boldsymbol{B}$	$\boldsymbol{A} \times \boldsymbol{B}$
dyadic product of vectors $\boldsymbol{A}$ and $\boldsymbol{B}$:	$\boldsymbol{AB}$	
scalar product of tensors S and T ($\Sigma_{i,k} S_{ik} T_{ki}$)	$\mathsf{S} : \mathsf{T}$	
tensor product of tensors S and T ($\Sigma_k S_{ik} T_{kl}$)	$\mathsf{S} \cdot \mathsf{T}$	$\mathsf{S}\,.\,\mathsf{T}$
product of tensor S and vector $\boldsymbol{A}$ ($\Sigma_k S_{ik} A_k$)	$\mathsf{S} \cdot \boldsymbol{A}$	$\mathsf{S}\,.\,\boldsymbol{A}$

3. *Division* of one quantity by another quantity may be indicated in one of the following ways:

$$\frac{a}{b} \qquad a/b \qquad a\ b^{-1}$$

or in any other way of writing the product of a and b^{-1}.

These procedures can be extended to cases where one of the quantities or both are themselves products, quotients, sums or differences of other quantities.
If necessary brackets have to be used in accordance with the rules of mathematics. If the solidus is used to separate the numerator from the denominator and if there is any doubt where the numerator starts or where the denominator ends, brackets should be used.

Examples:

Expressions with a horizontal bar:	*Same expressions with a solidus:*
$\frac{a}{bcd}$	a/bcd
$\frac{2}{9}\sin kx,\ \frac{1}{2}RT$	$(2/9)\sin kx,\ (1/2)RT$ or $RT/2$
$\frac{a}{b} - c$	$a/b - c$
$\frac{a}{b - c}$	$a/(b - c)$
$\frac{a - b}{c - d}$	$(a - b)/(c - d)$
$\frac{a}{c} - \frac{b}{d}$	$a/c - b/d$

Remark: It is recommended that in expressions like:

$\sin\{2\pi(x - x_0)/\lambda\}$	$\exp\{(r - r_0)/\sigma\}$
$\exp\{-V(r)/kT\}$	$\sqrt{(\epsilon/c^2)}$

the argument should always be placed between brackets, except when the argument is a simple product of two quantities: e.g. sin kx. When the horizontal bar above the square root is used no brackets are needed.

2. UNITS—GENERAL RECOMMENDATIONS.

2.1 Symbols for units—General rules.

1. *Symbols for units* of physical quantities should be printed in *roman (upright) type.*

2. *Symbols for units* should not contain a final full stop and should remain unaltered in the plural, e.g.: 7 cm and *not* 7 cms.

3. *Symbols for units* should be printed in *lower case* roman (upright) type. However, the symbol for a unit, derived from a proper name, should start with a capital roman letter, e.g.: m (metre); A (ampere); Wb (weber); Hz (hertz).

2.2 Prefixes—General rules.

1. The following *prefixes* should be used to indicate decimal fractions or multiples of a unit

deci; *déci*	$(= 10^{-1})$	d			
centi; *centi*	$(= 10^{-2})$	c			
milli; *milli*	$(= 10^{-3})$	m	kilo; *kilo*	$(= 10^{3})$	k
micro; *micro*	$(= 10^{-6})$	μ	mega; *méga*	$(= 10^{6})$	M
nano; *nano*	$(= 10^{-9})$	n	giga; *giga*	$(= 10^{9})$	G
pico; *pico*	$(= 10^{-12})$	p	tera; *téra*	$(= 10^{12})$	T
femto; *femto*	$(= 10^{-15})$	f			
atto; *atto*	$(= 10^{-18})$	a			

2. The use of *double prefixes* should be avoided when single prefixes are available.

Not: mμs,	*but:* ns	(nanosecond)
Not: kMW	*but:* GW	(gigawatt)
Not: μμF,	*but:* pF	(picofarad)

3. When a prefix is placed before the symbol of a unit, the *combination of prefix and symbol* should be considered as *one new symbol,* which can be raised to a positive or negative power without using brackets.

Examples:

$$\mathrm{cm^3} \quad , \quad \mathrm{mA^2} \quad , \quad \mu\mathrm{s}^{-1}$$

Remark:

$\mathrm{cm^3}$ *means always* $(0.01\ \mathrm{m})^3$ *but never* $0.01\ \mathrm{m^3}$
$\mu\mathrm{s}^{-1}$ *means always* $(10^{-6}\mathrm{s})^{-1}$ *but never* $10^{-6}\ \mathrm{s}^{-1}$

2.3 Mathematical operations.

1. *Multiplication* of two units may be indicated in one of the following ways:

Nm N m N · m N . m

2. *Division* of one unit by another unit may be indicated in one of the following ways:

$\frac{\text{m}}{\text{s}}$ m/s m s^{-1}

or by any other way of writing the product of m and s^{-1}.
Not more than one solidus should be used. *Examples:*

Not: cm/s/s,	*but:* cm/s^2 = cm s^{-2}
Not: 1 poise = 1 g/s/cm,	*but:* 1 poise = 1 g/s cm = 1 g/s^{-1} cm^{-1}
Not: J/°K/mol,	*but:* J/°K mol = J$°K^{-1}$ mol^{-1}

3. NUMBERS.

1. *Numbers* should be printed in *upright type.*

2. The *decimal sign* between digits in a number should be a comma (,) or (but *only* in *English* texts) a point (.).

3. The *multiplication* sign between numbers should be a cross (×) or (but *only in non-English* texts) a centered dot, e.g. 2.3 × 3.4 or 2,3 · 3,4.

4. *Division* of one number by another number may be indicated in the following ways:

$\frac{136}{273.15}$ 136/273.15

or by writing it as the product of numerator and the inverse first power of the denominator. In such cases the number under the inverse power should always be placed between brackets.

Remark: When the solidus is used and when there is any doubt where the numerator starts or the denominator ends, brackets should be used, as in the case of quantities (see 1.3.3).

5. To facilitate the reading of *long numbers,* the digits may be grouped in *groups of three,* but *no* comma or point should be used except for the decimal sign.
Example: 2 573. 421 736.

4. SYMBOLS FOR CHEMICAL ELEMENTS, NUCLIDES AND PARTICLES.

1. *Symbols for chemical elements* should be written in *roman* (upright) *type.* The symbol is not followed by full stop.
Examples: Ca C H He

2. The attached numerals specifying a *nuclide* are:

mass number $^{14}N_{2\ \text{atoms/molecule}}$

Remark: The atomic number may be placed as a left subscript, if desired. The right superscript position should be used, if required, for indicating a state of ionisation (e.g. Ca^{2+}, PO_4^{3-}) or an excited state (e.g. $^{110}Ag^m$, He^*).

3. *Symbols for particles and quanta.*
It is recommended that the following notation be used:

proton:	p	pion	π
neutron:	n	K-meson	K
Λ-particle	Λ	electron	e
Σ-particle	Σ	muon	μ
Ξ-particle	Ξ	neutrino	ν
deuteron	d		
triton	t	photon	γ
α-particle	α		

A nucleon (proton or neutron) is indicated by N
It is recommended that the charge of particles may be indicated by adding the superscript +, − or 0.
Examples:

π^+ π^- π^0, p^+ p^-, e^+ e^-.

If in connection with the symbols p and e no charge is indicated, these symbols should refer to the positive proton and the negative electron respectively.
The tilde $\sim$ above the symbol of a particle is used to indicate the corresponding anti-particle.

Examples:

$$\text{n},\ \nu,\ \sim\text{p},\ \sim\sim\text{N}$$

5. QUANTUM STATES.

5.1 General rules.

A letter-symbol indicating the quantum state of a *system* should be printed in capital upright type.
A letter-symbol indicating the quantum state of a *single particle* should be printed in lower case upright type.

5.2 Atomic spectroscopy.

The letter-symbols indicating atomic quantum states are:

$L, l = 0$: S, s	$L, l = 4$: G, g	$L, l = 8$: L, l
$= 1$: P, p	$= 5$: H, h	$= 9$: M, m
$= 2$: D, d	$= 6$: I, i	$= 10$: N, n
$= 3$: F, f	$= 7$: K, k	$= 11$: O, o

A right hand subscript indicates the total angular momentum quantum number J or j.
A left hand superscript indicates the spin multiplicity $2S + 1$.

Example: $^2\text{P}_{3/2}$—state ($J = 3/2$, multiplicity 2)
$\text{p}_{3/2}$—electron ($j = 3/2$)

An atomic electron configuration is indicated symbolically by:

$$(nl)^\kappa \quad (n'l')^{\kappa'} \ \ldots$$

Instead of $l = 0, 1, 2, 3 \ \ldots$ one uses the quantum state symbol s, p, d, f, . . .

Example: the atomic configuration: $(1\text{s})^2\,(2\text{s})^2\,(2\text{p})^3$.

5.3 Molecular spectroscopy.

The letter symbols, indicating molecular electronic quantum states are in the case of *linear molecules:*

$$\begin{aligned} \Lambda, \lambda = 0&: \ \Sigma, \sigma \\ = 1&: \ \Pi, \pi \\ = 2&: \ \Delta, \delta \end{aligned}$$

and for *non-linear molecules*

$$\text{A, a ;} \quad \text{B, b ;} \quad \text{E, e ;} \quad \text{etc.}$$

Remarks: A left hand superscript indicates the spin multiplicity. For molecules having a symmetry center the parity symbol g or u, indicating respectively symmetric or antisymmetric behaviour on inversion, is attached as a right hand subscript. A + or − sign attached as a right hand superscript indicates the symmetry as regards reflection in any plane through the symmetry axis of the molecules.

Examples: $\Sigma_g^+, \quad \Pi_u, \quad {}^2\Sigma, \quad {}^3\Pi, \quad$ etc.

The letter symbols indicating the vibrational angular momentum states in the case of *linear molecules* are

$$\begin{aligned} l = 0&: \ \Sigma \\ = 1&: \ \Pi \\ = 2&: \ \Delta \end{aligned}$$

5.4 Nuclear spectroscopy.

The spin and parity assignment of a nuclear state is

$$J^\pi$$

where the parity symbol π is + for even and − for odd parity.

Examples: $3^+, \quad 2^-, \quad$ etc.

A shell model configuration is indicated symbolically by:

$$(nlj)^\kappa \quad (n'l'j')^{\kappa'}$$

where the first bracket refers to the proton shell and the second to the neutron shell. Negative values of κ or κ' indicate holes in a completed shell. Instead of $l = 0, 1, 2, 3, \ \ldots$ one uses the quantum state symbols s, p, d, f, . . .

Example: the nuclear configuration: $(1\text{ d }_{3/2})^3\,(1\text{ f }_{7/2})^2$

5.5 Spectroscopic transitions.

1. The upper level and the lower level are indicated by $'$ and $''$ respectively.

Examples: $h\nu = E' - E'' \qquad \sigma = T' - T''$

2. A spectroscopic transition should be indicated by writing the upper state first and the lower state second, connected by a dash inbetween.

Examples:

$^2P_{3/2} - {}^2S_{1/2}$	for an electronic transition
$(J', K') - (J'', K'')$	for a rotational transition
$v' - v''$	for a vibrational transition.

3. Absorption transition and emission transition may be indicated by arrows ← and → respectively.

Examples:

$^2P_{3/2} \rightarrow {}^2S_{1/2}$ emission from $^2P_{3/2}$ to $^2S_{1/2}$
$(J', K') \leftarrow (J'', K'')$ absorption from (J'', K'') to (J', K')

4. The difference Δ between two quantum numbers should be that of the upper state minus that of the lower state.

Example: $\Delta J = J' - J''$

5. The indications of the branches of the rotation band should be as follows:

$\Delta J = J' - J'' = -2$:	O − branch
$= -1$:	P − branch
$= 0$:	Q − branch
$= +1$:	R − branch
$= +2$:	S − branch

6. NOMENCLATURE.

1. *Use of the word specific.*

The word 'specific' in English names for physical quantities should be restricted to the meaning 'divided by mass'. *Examples:*

specific volume	volume/mass
specific energy	energy/mass
specific heat capacity	heat capacity/mass

2. *Notation for covariant character of coupling.*

S	Scalar coupling	A	Axial vector coupling
V	Vector coupling	P	Psuedoscalar coupling
T	Tensor coupling		

3. *Abbreviated notation for a nuclear reaction.*

The meaning of the symbolic expression indicating a nuclear reaction should be the following:
initial nuclide (incoming particle(s), or quanta) (outgoing particle(s), or quanta) final nuclide

Examples: $^{14}N(\alpha,p)^{17}O$ $^{59}Co(n,\gamma)^{60}Co$
$^{23}Na(\gamma,3n)^{20}Na$ $^{31}P(\gamma,pn)^{29}Si$

4. *Character of transitions.*

Multipolarity of transition:

electric	or	magnetic	monopole	E0 or M0
"	"	"	dipole	E1 or M1
"	"	"	quadrupole	E2 or M2
"	"	"	octupole	E3 or M3
"	"	"	2^n-pole	E*n* or M*n*

parity change in transition:

transition *with* parity change:	yes
transition *without* parity change:	no

5. *Nuclide:* A species of *atoms*, identical as regards atomic number (proton number) and mass number (nucleon number) should be indicated by the word *nuclide*, not by the word isotope.
Different nuclides having the same atomic number should be indicated as *isotopes* or *isotopic nuclides*.
Different nuclides having the same mass number should be indicated as *isobars* or *isobaric nuclides*.

6. *Sign of polarization vector (Basel Convention).*

In nuclear interactions the positive polarization of particles with spin $\frac{1}{2}$ is taken in the direction of the vector product

$$\boldsymbol{k}_i \times \boldsymbol{k}_0,$$

where $\boldsymbol{k}_i$ and $\boldsymbol{k}_0$ are the circular wave vectors of the incoming and outgoing particles respectively.

7. RECOMMENDED SYMBOLS FOR PHYSICAL QUANTITIES.

Remark:
(1) Where several symbols are given for one quantity, and no special indication is made, they are on equal footing.
(2) In general, no special attention is paid to the name of the quantity.

7.1 Space and time.

space coordinates; *coordonnées d'espace*	(x, y, z)
position vector; *vecteur de position*	$\boldsymbol{r}$
length; *longueur*	l
breadth; *largeur*	b
height; *hauteur*	h
radius; *rayon*	r
thickness; *épaisseur*	d, δ
diameter; *diamètre:* $d = 2r$	d
path; *parcours:* $L = \int \mathrm{d}s$	L, s
area; *aire; superficie*	A, S
volume; *volume*	$V, (v)$
plane angle, *angle plan*	$\alpha, \beta, \gamma, \theta, \vartheta, \varphi$
solid angle; *angle solide*	ω, Ω
wave length; *longueur d'onde*	λ
wave number; *nombre d'onde* $\sigma = 1/\lambda$	σ *)
wave vector; *vecteur d'onde*	σ
circular wave number; *nombre d'onde circulaire:* $k = 2\pi/\lambda$	k
circular wave vector; *vecteur d'onde circulaire*	$\boldsymbol{k}$
attenuation coefficient; *constante d'affaiblissement:* $F(x) = \exp(-\alpha x)\cos\beta x$	α
phase coefficient; *constante de phase*	β
propagation coefficient; *constante de propagation:* $\gamma = \alpha + \mathrm{i}\beta$	γ
time; *temps*	t
period; *période*	T
frequency; *fréquence:* $\nu = 1/T$	ν, f
pulsatance; *pulsation:* $\omega = 2\pi\nu$	ω **)
relaxation time; *temps de relaxation:* $F(t) = \exp(-t/\tau)$	τ
damping coefficient; *coefficient d'amortissement:* $F(t) = \exp(-\delta t)\sin\omega t$	δ
logarithmic decrement; *décrément logarithmique:* $\Lambda = T\delta = T/\tau$	Λ
velocity; *vitesse:* $v = \mathrm{d}s/\mathrm{d}t$	u, v
angular velocity; *vitesse angulaire:* $\omega = \mathrm{d}\varphi/\mathrm{d}t$	ω
acceleration; *accélération:* $a = \mathrm{d}v/\mathrm{d}t$	a
angular acceleration; *accélération angulaire:* $\alpha = \mathrm{d}\omega/\mathrm{d}t$	α
acceleration of free fall; *accélération de la pesanteur*	g
standard — —; — — *normale*	g_n
speed of light in empty space; *vitesse de la lumière dans le vide*	c
v/c	β
relativistic coordinates; *coordonnées relativistes:*	$(x_0x_1x_2x_3)$
$x_0 = ct,\ x_1 = x,\ x_2 = y,\ x_3 = z,\ x_4 = ict$	$(x_1x_2x_3x_4)$

7.2 Mechanics.

mass; *masse*	m
(mass) density; *masse volumique:* $\rho = m/V$	ρ
relative density; *densité relative:* $d = \rho/\rho(\mathrm{H_2O})$	d
specific volume; *volume massique:* $v = V/m = 1/\rho$	v
reduced mass; *masse réduite:* $\mu = m_1m_2/(m_1 + m_2)$	μ
momentum; *quantité de mouvement:* $\boldsymbol{p} = m\boldsymbol{v}$	$\boldsymbol{p}$
angular momentum; *moment cinetiqué:* $\boldsymbol{L} = \boldsymbol{r} \times \boldsymbol{p}$	$\boldsymbol{L}$
second moment of plane area; *moment quadratique d'une aire plane:* $I_{a,y} = \int x^2\mathrm{d}x\mathrm{d}y$	I_a
second polar moment of plane area; *moment quadratique polaire d'une aire plane:* $I_p = \int(x^2 + y^2)\,\mathrm{d}x\mathrm{d}y$	I_p
moment of inertia; *moment d'inertie:* $I_z = \int(x^2 + y^2)\,\mathrm{d}m$	I, J
force; *force*	$\boldsymbol{F}$
torque, moment of a couple; *torque, moment d'un couple*	$\boldsymbol{T}$
weight; *poids*	$G, (W, P)$
moment of force; *moment d'une force*	$\boldsymbol{M}$
pressure; *pression*	p
normal stress; *tension normale*	σ
shear stress; *tension de cisaillement*	τ
gravitational constant; *constante de gravitation:* $F(r) = G\,m_1m_2/r^2$	G
linear strain, relative elongation; *dilation linéique relative:* $\epsilon = \Delta l/l_0$	ϵ
modulus of elasticity, Young's modulus; *module d'élasticité:* $\sigma = E\,\epsilon$	E
shear strain; shear angle; *glissement unitaire*	γ
shear modulus; *module de torsion:* $\tau = G\,\mathrm{tg}\,\gamma$	G
volume strain, bulk strain; *dilation volumique relative:* $\theta = \Delta V/V_0$	θ
bulk modulus; *module de compression:* $p = -K\theta$	K
Poisson ratio, *rapport de Poisson*	μ, ν
viscosity; *viscosité*	$\eta, (\mu)$
kinematic viscosity; *viscosité cinématique:* $\nu = \eta/\rho$	ν
friction coefficient; *coefficient de frottement*	$\mu, (f)$
surface tension; *tension superficielle*	γ, σ
energy; *énergie*	E, W
potential energy; *énergie potentielle*	E_p, V, Φ
kinetic energy; *énergie cinétique*	E_k, T, K
work; *travail*	W, A

*) In molecular spectroscopy: $\tilde{\nu}$. **) Also called angular frequency.

power; *puissance*	P
efficiency; *rendement*	η
Hamiltonian function; *fonction de Hamilton*	H
Lagrangian function; *fonction de Lagrange*	L
principal function of Hamilton; *fonction principale de Hamilton:* $W = \int L\mathrm{d}t$	W, S_1
characteristic function of Hamilton; *fonction caractéristique de Hamilton:* $S = 2\int T\mathrm{d}t$	S
generalized coordinate; *coordonnée généralisée*	q, q_i
generalized momentum; *moment généralisé*	p, p_i
action integral; *intégrale d'action:* $J = \oint p\mathrm{d}q$	J

7.3 Molecular physics.

number of molecules; *nombre de molécules*	N
number density of molecules; *nombre volumique de molécules* $n = N/V$	n
Avogadro constant; *constante d'Avogadro*	L, N_A
molecular mass; *masse moléculaire*	m
molecular velocity vector with components; *vecteur vitesse moléculaire et ses composantes*	$\boldsymbol{c}$, (c_x, c_y, c_z) $\boldsymbol{u}$, (u_x, u_y, u_z)
molecular position vector with components; *vecteur position moléculaire et ses composantes*	$\mathbf{r}$, (x, y, z)
molecular momentum vector with components; *vecteur quantité de mouvement moléculaire et ses composantes*	$\boldsymbol{p}$, (p_x, p_y, p_z)
average velocity; *vitesse moyenne*	$\boldsymbol{c}_0$, $\boldsymbol{u}_0$, $\langle\boldsymbol{c}\rangle$, $\langle\boldsymbol{u}\rangle$
average speed; *vitesse moyenne*	$\bar{c}$, $\bar{u}$, $\langle c\rangle$, $\langle u\rangle$
most probable speed; *vitesse la plus probable*	$\hat{c}$, $\hat{u}$
mean free path; *libre parcours moyen*	l
molecular attraction energy; *énergie d'attraction moléculaire*	ϵ
interaction energy between molecules i and j; *énergie d'interaction entre les molécules i et j*	φ_{ij}, V_{ij}
velocity distribution function; *fonction de distribution des vitesses:* $n = \int f\,\mathrm{d}c_x\mathrm{d}c_y\mathrm{d}c_z$	$f(c)$
Boltzmann function; *fonction de Boltzman*	H
generalized coordinate; *coordonnée généralisée*	q
generalized momentum; *moment généralisé*	p
volume in γ phase space; *volume dans l'espace* γ	Ω
thermodynamic temperature; *température thermodynamique*	T
Boltzmann constant; *constante de Boltzmann*	k
$1/kT$ (in exponential functions; *dans les fonctions exponentielles*)	β
molar gas constant; *constante molaire des gaz*	R
partition function; *fonction de partitions*	Q, Z
symmetry number; *facteur de symétrie*	s
diffusion coefficient; *coefficient de diffusion*	D
thermal diffusion coefficient; *coefficient de thermodiffusion*	D_T
thermal diffusion ratio; *rapport de thermodiffusion*	K_T
thermal diffusion factor; *facteur de thermodiffusion*	α_T
characteristic temperature; *température caractéristique*	Θ
Debye temperature; *température de Debye:* $\Theta_D = h\nu_D/k$	Θ_D
Einstein temperature; *température d'Einstein:* $\Theta_E = h\nu_E/k$	Θ_E
rotational temperature; *température de rotation:* $\Theta_r = h^2/8\pi^2 Ik$	Θ_r
vibrational temperature; *température de vibration:* $\Theta_v = h\nu/k$	Θ_v

*7.4 Thermodynamics.**)

quantity of heat; *quantité de chaleur*	Q
work; *travail*	W, A
temperature; *température*	t, (ϑ) *)
thermodynamic temperature; *température thermodynamique*	T, (Θ) **)
entropy; *entropie*	S
internal energy; *énergie interne*	U
Helmholtz function; *fonction de Helmholtz, énergie libre:* $F = U - TS$	F
enthalpy; *enthalpie:* $H = U + pV$	H
Gibbs function; *fonction de Gibbs, enthalpie libre:* $G = H - TS$	G
pressure coefficient; *coefficient d'augmentation de pression:* $\beta = (1/p)(\partial p/\partial T)_V$	β
compressibility; *compressibilité:* $\kappa = -(1/V)(\partial V/\partial p)_T$	κ
linear expansion coefficient; *coefficient de dilatation linéique*	α
cubic expansion coefficient; *coefficient de dilatation volumique*	γ
thermal conductivity; *conductivité thermique*	λ
specific heat capacity; *chaleur massique:* $c = C/m$	c_p, c_v
heat capacity; *capacité thermique*	C_p, C_v
Joule-Thomson coefficient; *coefficient de Joule-Thomson*	μ
ratio of specific heat capacities; *rapport des chaleurs massiques*	κ, γ
heat flow rate; *flux thermique*	Φ, (q)
heat current density; *densité de flux thermique*	$\boldsymbol{q}$, (φ)
thermal diffusivity; *diffusivité thermique:* $a = \lambda/\rho c_p$	a

†) The index m is added in the case of molar quantities, if needed, to distinguish them from quantities referring to the whole system. For specific quantities (see 6.1) lower case letters are used.

*) Preferred symbol: t. **) Preferred symbol: T.

7.5 *Electricity and magnetism.*††)

quantity of electricity; *quantité d' électricité*	Q
charge density; *charge volumique*	ρ
surface charge density; *charge surfacique*	σ
electric potential; *potential électrique*	V, φ
potential difference, tension; *différence de potentiel, tension*	U, V
electromotive force; *force électromotrice*	E
electric field strength; *champ électrique*	$\boldsymbol{E}$
electric flux; *flux électrique*	Ψ
electric displacement; *déplacement électrique*	$\boldsymbol{D}$
capacitance; *capacité*	C
permittivity; *permittivité:* $\boldsymbol{D} = \epsilon \boldsymbol{E}$	ϵ
permittivity of vacuum; *permittivité du vide*	ϵ_0
relative permittivity; *permittivité relative* $\epsilon_r = \epsilon/\epsilon_0$	ϵ_r
dielectric polarization: *polarisation diélectrique:* $\boldsymbol{D} = \epsilon_0 \boldsymbol{E} + \boldsymbol{P}$	$\boldsymbol{P}$
electric susceptibility; *susceptibilité électrique*	χ_e
polarizability; *polarisabilité*	α, γ
electric dipole moment; *moment dipolaire électrique*	$\boldsymbol{p}$
electric current; *courant électrique*	I
electric current density; *densité de courant électrique*	$\boldsymbol{j}$
magnetic field strength; *champ magnétique*	$\boldsymbol{H}$
magnetic potential difference; *différence de potential magnétique*	U_m
magnetomotive force; *force magnétomotrice:* $F_m = \oint H_s ds$	F_m
magnetic induction, magnetic flux density; *induction magnétique, densité de flux magnétique*	$\boldsymbol{B}$
magnetic flux; *flux magnétique*	Φ
permeability; *perméabilité:* $\boldsymbol{B} = \mu \mathbf{H}$	μ
permeability of vacuum; *perméabilité du vide*	μ_0
relative permeability; *perméabilité relative:* $\mu_r = \mu/\mu_0$	μ_r
magnetization; *aimantation:* $\boldsymbol{B} = \mu_0(\mathbf{H} + \mathbf{M})$	$\mathbf{M}$
magnetic susceptibility; *susceptibilité magnétique*	χ_m
electromagnetic moment; *moment électromagnétique:* $E_p = -\boldsymbol{m} . \boldsymbol{B}$	μ, $\boldsymbol{m}$
magnetic polarization; *polarisation magnétique:* $\boldsymbol{B} = \mu_0 \mathbf{H} + \boldsymbol{J}$	$\boldsymbol{J}$
resistance; *résistance*	R
reactance; *réactance*	X
quality factor: *facteur de qualité:* $Q = \lvert X \rvert / R$	Q
impedance; *impédance:* $Z = R + \mathrm{i}\, X$	Z
admittance; *admittance:* $Y = 1/Z = G + \mathrm{i}B$	Y
conductance; *conductance*	G
susceptance; *susceptance*	B
resistivity; *résistivité*	ρ
conductivity; *conductivité* $\gamma = 1/\rho$	γ, σ
self inductance; *inductance propre*	L
mutual inductance; *inductance mutuelle*	M, L_{12}
coupling coefficient; *coefficient de couplage:* $k = L_{12}/(L_1 L_2)^{1/2}$	k
phase number; *nombre de phases*	m
loss angle; *angle de pertes*	δ
number of turns; *nombre de tours*	N
power: *puissance*	P
electromagnetic energy density; *énergie électromagnetique volumique*	w
Poynting vector; *vecteur de Poynting*	$\boldsymbol{S}$
magnetic vector potential; *potentiel vecteur magnétique*	$\boldsymbol{A}$

7.6 *Radiation, light.*†)

radiant energy; *énergie rayonnante*	Q, (Q_e), W
radiant flux, radiant power; *flux énergétique, puissance rayonnante*	Φ, (Φ_e), P
radiant intensity; *intensité énergétique*	I, (I_e)
irradiance; *irradiance, éclairement énergétique*	E, (E_e)
radiance; *luminance énergétique, radiance*	L, (L_e)
radiant emittance; *émittance énergétique*	M, (M_e)
quantity of light; *quantité de lumière*	Q, (Q_V)
luminous flux; *flux lumineux*	Φ, (Φ_V)
luminous intensity; *intensité lumineuse:* $\mathrm{d}\Phi/\mathrm{d}\omega$	I, (I_V)
illuminance, illumination; *éclairement lumineux:* $\mathrm{d}\Phi/\mathrm{d}S$	E, (E_V)
luminance; *luminance:* $\mathrm{d}I/\mathrm{d}S \cos \vartheta$	L, (L_V)
luminous emittance; *émittance lumineuse:* $\mathrm{d}\Phi/\mathrm{d}S$	M, (M_V)
absorption factor; *facteur d'absorption:* Φ_a/Φ_0	α
reflection factor; *facteur de réflexion* Φ_r/Φ_0	ρ
transmission factor; *facteur de transmission* Φ_{tr}/Φ_0	τ
(linear) absorption coefficient; *coefficient d'absorption (linéique)*	a
(linear) extinction coefficient; *coefficient d'atténuation (linéique)*	μ
speed of light in empty space; *vitesse de la lumière dans le vide*	c
refractive index; *indice de réfraction:* $n = c/c_n$	n

††) Written in rationalized, 4-dimensional form. See Appendix, section 2.

†) The symbols between brackets are reserve symbols and are to be used whenever it is necessary to distinguish between radiation and light quantities.

7.7 Acoustics.

velocity of sound; *vitesse du son*	c
velocity of longitudinal waves; *vitesse longitudinale*	c_l
velocity of transversal waves; *vitesse transversale*	c_t
group velocity; *vitesse de groupe*	c_g
sound energy flux; *flux énergétique du son*	P
reflexion factor; *facteur de réflexion:* P_r/P_0	ρ
acoustic absorption factor; *facteur d'absorption acoustique* $1 - \rho$	α_a (α)
transmission factor; *facteur de transmission:* P_{tr}/P_e	τ
dissipation factor; *facteur de dissipation:* $\alpha_a - \tau$	δ
loudness level; *niveau d'isosonie*	L_N, (Λ)

7.8 Quantum mechanics.

complexe conjugate of Ψ; *complexe conjugué de* Ψ	Ψ^*
probability density; *densité de probabilité:* $P = \Psi^*\Psi$	P
probability current density: *densité de courant de probabilité:* $S = (\hbar/2im)(\Psi^*\Delta\Psi - \Psi\Delta\Psi^*)$	S
charge density of electrons; *charge volumique d'électrons:* $\rho = -eP$	ρ
electric current density of electrons; *densité de courant électrique d'électrons:* $j = -eS$	j
expectation value of A; *valeur moyenne de* A	$\langle A \rangle$, $\bar{A}$
commutator of A and B, *commutateur de* A *et* B: $[A,B] = AB - BA$	$[A,B]$, $[A,B]$
anticommutator of A and B; *anticommutateur de* A *et* B: $[A,B]_+ = AB + BA$	$[A,B]_+$
matrix element; *élément de matrice:* $A_{ij} = \int \psi_i^*(A\psi_j)\,d\tau$	A_{ij}
Hermitian conjugate of operator A; *conjugué Hermitien de l'opérateur* A	$A\dagger$
momentum operator in coordinate representation; *opérateur de quantité de mouvement*	$+(\hbar/i)\Delta$
annihilation operators; *opérateurs d'annihilation*	a, b, α, β
creation operators; *opérateurs de création*	a^+, $b\dagger$, $\alpha\dagger$ $\beta\dagger$

7.9 Atomic and nuclear physics.

mass number, nucleon number; *nombre de masse, nombre de nucléons*	A
atomic number, proton number; *nombre atomique, nombre de protons*	Z
neutron number; *nombre de neutrons:* $N = A - Z$	N
elementary charge (of position); *charge élémentaire (du position)*	e
electron mass; *masse de l'électron*	m, m_e
proton mass; *masse du proton*	m_p
neutron mass; *masse du neutron*	m_n
meson mass; *masse du méson*	m_π,
nuclear mass; *masse nucléaire* (of nucleus: ^{A}X)	m_N, m_N (^{A}X)
atomic; mass; *masse atomique* (of nuclide: ^{A}X)	m_a, m_a (^{A}X)
(unified) atomic mass constant; *constante* (unifiée) *de masse atomique:* $m_u = m_a(^{12}C)/12$	m_u
relative atomic mass; *masse atomique relative:* m_a/m_u	A_r
Planck constant; *constante de Planck* ($\hbar = h/2\pi$)	$\hbar$
principal quantum number; *nombre quantique principal*	n, n_i
orbital angular momentum quantum number; *nombre quantique de moment angulaire orbital*	L, l_i
spin quantum number; *nombre quantique de spin*	S, s_i
angular momentum quantum number; *nombre quantique de moment angulaire* (including electron spin)	J, j_i
magnetic quantum number; — — *magnétique*	M, m_i
nuclear spin quantum number; — — *de spin nucléaire*	I, J *)
hyperfine quantum number; — — *hyperfin*	F
rotational quantum number; — — *de rotation*	J, K
vibrational quantum number; — — *de vibration*	v
quadrupole moment; *moment quadripolaire*	Q
Rydberg constant; *constante de Rydberg***)	R_∞
Bohr radius; *rayon de Bohr***)	a_0
fine structure constant; *constante de structure fine***)	α
mass excess; *excès de masse:* $m_a - Am_u$	Δ
packing fraction; *packing fraction:* Δ/Am_u	f
nuclear radius; *rayon nucléaire:* $R = r_0A^{1/3}$	R
magnetic moment of particle: *moment magnétique d'une particule*	μ
magnetic moment of proton; *moment magnétique du proton*	μ_p
magnetic moment of neutron; *moment magnétique du neutron*	μ_n
magnetic moment of electron; *moment magnétique électronique*	μ_e
Bohr magneton; *magnéton de Bohr***)	μ_B
nuclear magneton; *magnéton nucléaire*	μ_N
g-factor; *facteur g:* e.g. $g = \mu/I\mu_N$	g
gyromagnetic ratio; *rapport gyromagnétique***)	γ
Larmor (angular) frequency; *fréquence (angulaire) de Larmor***)	ω_L
level width; *largeur d'un niveau*	Γ

*) I is used in atomic physics. J in nuclear physics.
**) See for definition: Appendix, section 2.

mean life; *vie moyenne*	τ
reaction energy; *énergie de réaction*	Q
cross section; *section efficace*	σ
macroscopic cross section; *section efficace macroscopique:* $\Sigma = n\sigma$	Σ
impact parameter; *paramètre de collision*	b
scattering angle; *angle de diffusion*	ϑ, θ, φ
internal conversion coefficient; *coefficient de conversion interne*	α
disintegration energy; *énergie de désintégration*	Q
half life; *demi-vie*	$T_{\frac{1}{2}}$
reduced half life; *demi-vie réduite*	$fT_{\frac{1}{2}}$
decay constant, disintegration constant; *constante de désintégration*	λ
activity; *activité*	A
Compton wavelength; *longueur d'onde de Compton:* $\lambda_C = h/mc$	λ_C
electron radius; *rayon de l'électron***)	r_e
linear attenuation coefficient; *coeff. d'atténuation linéique*	μ, μ_l
atomic attenuation coefficient; *coeff. d'atténuation atomique*	μ_a
mass attenuation coefficient; *coeff. d' atténuation massique*	μ_m
linear stopping power; *pouvoir d' arrêt linéaire*	S, S_l
atomic stopping power; *pouvoir d' arrêt atomique*	S_a
linear range; *distance de pénétration linéaire*	R, R_l
recombination coefficient; *coefficient de recombinaison*	α

7.10 Solid state physics.

fundamental translations for lattice; *translations fondamentales d'un réseau*	$\boldsymbol{a}$, $\boldsymbol{b}$, $\boldsymbol{c}$ $\boldsymbol{a}_1$, $\boldsymbol{a}_2$, $\boldsymbol{a}_3$
Miller indices; *indices de Miller*	h, k, l h_1, h_2, h_3
plane in lattice; *plan d'un réseau**)	(h, k, l) (h_1, h_2, h_3)
direction in lattice; *direction dans un réseau**)	$[h, k, l]$ $[h_1, h_2, h_3]$
fundamental translations in reciprocal lattice; *translations fondamentales de reseau réciproque*	$\boldsymbol{a}^*$, $\boldsymbol{b}^*$, $\boldsymbol{c}^*$ $\boldsymbol{b}_1$, $\boldsymbol{b}_2$, $\boldsymbol{b}_3$
vector in crystal lattice; *vecteur dans un réseau*	$\boldsymbol{r}$
distance between successive lattice planes; *distance de plans successifs d'un réseau*	d
Bragg angle; *angle de Bragg*	θ, ϑ
order of reflexion; *ordre du réflexion*	n
short range order parameter; *paramètre d'ordre (proche voisin)*	σ
long range order parameter; *paramètre d'ordre (longue distance)*	s
Burgers vector; *vecteur de Burgers*	$\boldsymbol{b}$
circular wave vector; propagation vector (of phonons); *vecteur d'onde circulaire, vecteur de propagation (de phonons)*	$\boldsymbol{q}$
circular wave vector, propagation vector (of particles); *vecteur d'onde circulaire, vecteur de propagation (de particules)*	$\boldsymbol{k}$
effective mass of electron; *masse effective d'une électron*	m^*, m_{eff}
Fermi energy; *énergie de Fermi*	E_F, ϵ_F
Fermi circular wave vector; *vecteur d'onde circulaire de Fermi*	$\boldsymbol{k}_F$
work function; *fonction de travail*	Φ
differential thermoelectric power; *force thermoélectrique différentielle*	S, (Σ)
Peltier coefficient; *coefficient de Peltier*	Π
Thomson coefficient; *coefficient de Thomson*	μ
piezoelectric coefficient; *coefficient piézoélectrique:* (polarization/stress)	d_{mn}
characteristic (Weiss) temperature; *température caractéristique (de Weiss)*	Θ, Θ_w
Curie temperature; *température de Curie*	T_C
Neel temperature; *température de Néel*	T_N
Hall coefficient; *coefficient de Hall*	R_H

7.11 Molecular spectroscopy.

qu.n. of component of electronic orbital angular momentum vector along symmetry axis; *n.qu. de la composante du moment angulaire orbital électronique suivant l'axe de symétrie*	Λ, λ_i
qu.n. of component of electronic spin along symmetry axis; *n.qu. de la composante du spin électronique suivant l'axe de symétrie*	Σ, σ_i
qu.n. of total electronic angular momentum vector along symmetry axis; *n.qu. du moment angulaire total électronique suivant l'axe de symétrie*	Ω, ω_i
qu.n. of electronic spin; *n.qu. du spin électronique*	S
qu.n. of nuclear spin; *n.qu. du spin nucléaire*	I
qu.n. of vibrational mode; *n.qu. d'une mode de vibration*	v
degeneracy of vibrational mode; *degré de dégénérescance d'une mode de vibration*	d
qu.n. of vibrational angular momentum; *n.qu. de moment angulairevibrationnel* (L.M.)	l
qu.n. of total angular momentum; *n.qu. de moment angulair total* (excluding nuclear spin)	J
qu.n. of component of $\boldsymbol{J}$ in direction of external field; *n.qu. de la composante de* $\boldsymbol{J}$ *dans la direction du champ extérieur*	M, M_J

*) Instead of the ordinary brackets ( ) and square brackets [ ], curly brackets { } and diamond brackets ⟨ ⟩ are also used respectively.

qu.n. of component of $\boldsymbol{S}$ in direction of external field; *n.qu. de la composante de* $\boldsymbol{S}$ *dans la direction du champ extérieur*	M_S
qu.n. of total angular momentum; *n.qu. du moment angulaire total* (including nuclear spin) $\boldsymbol{F} = \boldsymbol{J} + \boldsymbol{I}$	F
qu.n. of component of $\boldsymbol{F}$ in direction of external field; *n.qu. de la composante de* $\boldsymbol{F}$ *dans la direction du champ extérieur*	M_F
qu.n. of component of $\boldsymbol{I}$ in direction of external field; *n.qu. de la composante de* $\boldsymbol{I}$ *dans la direction du champ extérieur*	M_I
qu.n. of component of angular momentum along axis; *n.qu. de la composante du moment angulaire suivant l'axe* (L.M. and S.T.M.; excluding electron- and nuclear spin; for L.M.: $(K = \lvert\Lambda + l\rvert)$	K
qu.n. of total angular momentum; *n.qu. du moment angulaire total* (L.M. and S.T.M.; excluding electron and nuclear spin: $\boldsymbol{J} = \boldsymbol{N} + \boldsymbol{S}$*)	N
qu.n. of component of angular momentum along symmetry axis; *n.qu. de la composante du moment angulaire suivant l'axe de symétrie* (L.M. and S.T.M., excluding nuclear spin; for L.M.: $P = \lvert K + \Sigma\rvert$**)	P
electronic term; *terme électronique:* $T_e = E_e/hc$†)	T_e
vibrational term; *terme de vibration:* $G = E_{vibr}/hc$	G
coefficients in expression for vibrational term (for D.M.); *coefficients de l'expression d'un terme de vibration:* $G = \sigma_e(v + \frac{1}{2}) - x\sigma_e(v + \frac{1}{2})^2$	σ_e, $x\sigma_e$
coefficients in expression for vibrational term (for P.M.) *coefficients de l'expression d'un terme de vibration:* $G = \Sigma\sigma_i(v_i + \frac{1}{2}d_i) + \frac{1}{2}\Sigma\Sigma x_{jk}(v_j + \frac{1}{2}d_j)(v_k + \frac{1}{2}d_k)$	σ_i, x_{jk}
rotational term; *terme de rotation:* $F = E_{rot}/hc$	F
principal moments of inertia; *moments principaux d'inertie:* $I_A \leqslant I_B \leqslant I_C$††)	I_A, I_B, I_C
rotational constants; *constants de rotation:* $A = h/8\pi^2cI_A$, etc.††)	A, B, C
total term; *terme total:* $T = T_e + G + F$	T

Remark: L.M. = linear molecules. *S.T.M.* = symmetric top molecules.
D.M. = diatomic molecules. P.M. = polyatomic molecules.
See for further details: Report on Notation for the Spectra of Polyatomic Molecules (Joint Commission for Spectroscopy of I.U.P.A.P. and I.A.U. 1954) J. Chem. Phys. ***23*** (1955) 1997.

factorial p; *factorielle p*	$p!$
binomial coefficient; *coefficient binomial:* $n!/p!(n-p)!$	$\binom{n}{p}$
infinity; *infini*	∞

8.2 Letter symbols and letter expressions for *mathematical operations* should be written in *roman* (or *upright*) type

exponential of x; *exponentielle de x*	$\exp x$, e^x	
base of natural logarithms; *base des logarithmes népériens*	e	
logarithm to the base a of x; *logarithme de base a de x*	$\log_a x$	
natural logarithm of x; *logarithme népérien de x*	$\ln x$	
common logarithm of x; *logarithme décimal de x*	$\lg x$, $\log x$	*)
binary logarithm of x; *logarithme binaire de x*	$\mathrm{lb}\ x$ $\log_2 x$	
summation; *somme*	Σ	
product; *produit*	Π	
finite increase of x; *accroissement fini de x*	Δx	**)
variation of x; *variation de x*	δx	
total differential of x; *différentielle totale de x*	dx	
function of x; *fonction de x*	$f(x)$, $\mathrm{f}(x)$	
limit of $f(x)$; *limite de f(x)*	$\lim f(x)$	
Dirac delta function; *fonction delta de Dirac* $\delta(\mathbf{r}) = \delta(x)\delta(y)\delta(z)$	$\delta(x)$, $\delta(\mathbf{r})$	
Kronecker delta symbol; *symbole delta de Kronecker*	δ_{ij}	
Unit step function; *fonction unité*($\epsilon(x) = 1$ for $x > 0$, $\epsilon(x) = 0$ for $x < 0$)	$\epsilon(x)$	†)

8.3 Trigonometric functions.

sine of x, *sinus x*	$\sin x$
cosine of, *cosinus x*	$\cos x$
tangent of x, *tangente x*	$\tan x$, $\mathrm{tg}\ x$
cotangent of x, *cotangente x*	$\cot x$, $\mathrm{ctg}\ x$
secant of x, *sécante x*	$\sec x$
cosecant of x, *cosécante x*	$\mathrm{cosec}\ x$

Remarks:

a. It is recommended to use for the *inverse circular functions* the symbolic expressions for the corresponding circular function preceded by the letters: arc.
Examples: arcsin x, arccos x, arctan x or arctg x, etc. Sometimes the notation $\sin^{-1} x$, $\tan^{-1} x$, etc. is used.

b. It is recommended to use for the *hyperbolic functions* the symbolic expressions for the corresponding circular function, followed by the letter: h.
Examples: sinh x, cosh x, tanh x or tgh x, etc.

c. It is recommended to use for the *inverse hyperbolic functions* the symbolic expression for the corresponding hyperbolic function preceded by the letters: ar.

Example: arsinh x, arcosh x, etc.

8.4 Complex quantities.

imaginary unit; *unité imaginaire* ($\mathrm{i}^2 = -1$)	i, j
real part of z; *partie réelle de z*	$\mathrm{Re}\ z$, z'
imaginary part of z; *partie imaginaire de z*	$\mathrm{Im}\ z$, z''
modulus of z; *module de z*	$\lvert z \rvert$
argument of z; *argument de* $z : z = \lvert z \rvert \exp \mathrm{i}\varphi$	$\arg z$, φ
complex conjugate of z, conjugate of z; *complexe conjugué de z, conjugué de z*	z^*

Remark: Sometimes the notation $\bar{z}$ is used for the complex conjugate of z.

*) In case of ambiguity $\log_{10} x$. **) Greek capital delta, not triangle.
†) $\Theta(t)$ is used for unit step function of time.

8.5 Symbols for special values of periodic quantities.

	Normal case		Exceptional case	
instantaneous value	x	x	x	x
r.m.s. value	x_{eff}	$\tilde{x}$	X	X
maximum value	x_{m}	$\hat{x}$	x_{m}, X_{m}	$\hat{x}$, $\hat{X}$
average value	x_{av}	$\bar{x}$, $\langle x \rangle$	x_{av}	$\bar{x}$, $\langle x \rangle$

Remarks:

a. The "normal" case is the case in which only a small or only a capital letter may be used for the quantity. The "exceptional" case is the case in which both small and capital letters may be used for the same quantity.

b. The minimum value of x may be indicated by $x_{\min}$ or $\check{x}$.

c. The r.m.s.value is defined as $\tilde{x}^2 = T^{-1} \int_0^T x\,(t)^2 \mathrm{d}t$.

d. The average value is defined as $\bar{x} = T^{-1} \int_0^T x\,(t) \mathrm{d}t$.

8.6 Vector calculus. (see also *1.2.3*)

absolute value; *valeur absolue*	$\lvert \boldsymbol{A} \rvert$, A
differential vector operator; *vecteur opérateur différentiel*	$\partial/\partial \boldsymbol{r}$, ∇
gradient; *gradient*	grad φ, $\nabla\varphi$
divergence; *divergence*	div $\boldsymbol{A}$, $\nabla \cdot \boldsymbol{A}$
curl; *rotationnel*	curl $\boldsymbol{A}$, rot $\boldsymbol{A}$, $\nabla \times \boldsymbol{A}$
Laplacian; *Laplacien*	$\triangle\varphi$, $\nabla^2\varphi$
Dalembertian; *Dalembertien*	$\Box\varphi$

8.7 Matrix calculus.

transpose of matrix A; *matrice transposée de* A: $A_{ij} = A_{ji}$	$\tilde{A}$
complex conjugate of A; *matrice complexe conjuguée de* A: $A^*_{ij} = (A_{ij})^*$	A^*
Hermitian conjugate of A; *matrice conjuguée Hermitienne de* A: $A\dagger_{ji} = A_{ji}{}^*$	$A\dagger$
Pauli matrices; *matrices de Pauli:*	σ, σ_x, σ_y, σ_z

$$\sigma_x = \begin{vmatrix} 0 & 1 \\ 1 & 0 \end{vmatrix} \qquad \sigma_y = \begin{vmatrix} 0 & -\mathrm{i} \\ \mathrm{i} & 0 \end{vmatrix} \qquad \sigma_z = \begin{vmatrix} 1 & 0 \\ 0 & -1 \end{vmatrix} \qquad \sigma_1,\ \sigma_2,\ \sigma_3$$

unit matrix; *matrice unité:* $I = \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix}$ $\qquad I$

Dirac (4×4) matrices; (4×4) *matrices de Dirac* *)

$$\alpha_x = \begin{vmatrix} 0 & \sigma_x \\ \sigma_x & 0 \end{vmatrix} \qquad \alpha_y = \begin{vmatrix} 0 & \sigma_y \\ \sigma_y & 0 \end{vmatrix} \qquad \alpha_z = \begin{vmatrix} 0 & \sigma_z \\ \sigma_z & 0 \end{vmatrix} \qquad \alpha,\ \alpha_x,\ \alpha_y,\ \alpha_z$$

$$\beta = \begin{vmatrix} I & 0 \\ 0 & -I \end{vmatrix} \qquad \beta$$

9. INTERNATIONAL SYMBOLS FOR UNITS.

9.1 Unit systems.

1. A *coherent system of units* is a system based on a certain set of "basic units" from which all "derived units" are obtained by multiplication or division without introducing numerical factors. In addition there are "dimensionless units," in particular the radian, symbol: rad, for plane angle and the steradian, symbol: sr, for solid angle.

2. The ***CGS system*** or cm-g-s system is a coherent system of units based on *three basic units* for the three basic quantities length, mass and time respectively:

centimetre	cm
gramme	g
second	s

*) Sometimes a different representation is used.

In the field of *mechanics* the following units of this system have special names and symbols, which have been approved by the Conférence Générale des Poids et Mesures:

l, b, h	centimetre; *centimètre*	cm
t	second; *seconde*	s
m	gramme; *gramme*	g
f, v	hertz; *hertz* ($= s^{-1}$)	Hz
F	dyne; *dyne* ($= g.cm/s^2$)	dyn
E, U, W, A	erg; *erg* ($= g.cm^2/s^2$)	erg
p	microbar; *microbar* ($= dyn/cm^2$)	μbar
η	poise; *poise* ($= dyn.\ s/cm^2$)	P

In the field of *electricity and magnetism* several variants of the CGS unit system have been developed, in particular the *electrostatic CGS system* and *electromagnetic CGS system*. Special names and symbols for some of the units of the second system are:*)

*H**	oersted; *oersted* ($= cm^{-\frac{1}{2}}.g^{\frac{1}{2}}.s^{-1}$)	Oe
*B**	gauss; *gauss* ($= cm^{-\frac{1}{2}}.g^{\frac{1}{2}}.s^{-1}$)	G
Φ*	maxwell; *maxwell* ($= cm^{\frac{3}{2}}.g^{\frac{1}{2}}s^{-1}$)	Mx

For further information about the units and unit systems in electricity and magnetism see appendix, section 2.

3. The ***MKSA system*** or m-kg-s-A system is a coherent system of units for mechanics, electricity and magnetism, based on *four basic units* for the four basic quantities length, mass, time and electric current intensity:

metre	m
kilogramme	kg
second	s
ampere	A

Remark: The system based on these four units has been given the name *Giorgi system* by the International Electrotechenical Committee in 1958. The subsystem for mechanics, which is based on the first three units only, has the name *MKS system.*

The following units of the MKSA system have special names and symbols, which have been approved by the Conférence Générale des Poids et Measures:

l. b. h	metre; *mètre*	m
t	second; *seconde*	s
m	kilogramme; *kilogramme*	kg
v, f	hertz; *hertz* ($= s^{-1}$)	Hz
F	newton; *newton* ($= kg.m/s^2$)	N
E	joule; *joule* ($= kg.m^2/s^2$)	J
P	watt; *watt* ($= J/s$)	W

I	ampere; *ampère*	A
Q	coulomb; *coulomb* ($= A.s$)	C
V	volt; *volt* ($= W/A$)	V
C	farad; *farad* ($= C/V$)	F
R	ohm; *ohm* ($= V/A$)	Ω
L	henry; *henry* ($= V.s/A$)	H
Φ	weber; *weber* ($= V.s$)	Wb
B	tesla; *tesla* ($= Wb/m^2$)	T

4. The ***degree Kelvin.*** In the field of *thermodynamics* one introduces an additional basic unit, corresponding to the basic quantity:

thermodynamic temperature, the unit being the degree Kelvin, symbol: °K
When the *customary temperature* is used, defined by $t = T - T_0$, where $T_0 = 273.15$°K, this is usually expressed in degree Celsius symbol: °C. For *temperature interval* the name degree, symbol: deg is often used, the indications "Kelvin" or "Celsius," indicating the zeropoint of the temperature scale used, being irrelevant in this case.

5. The ***candela.***

In the field of *photometry* one introduces an additional basic unit, corresponding to the basic quantity: *luminous intensity*, this unit being the candela, symbol: cd. Special names and symbols for units in this field are:

I	candela; *candéla*	cd
Φ	lumen; *lumen*	lm
E	lux; *lux* ($= lm/m^2$)	lx

*) See also Appendix.

6. The ***International System of Units.*** For the coherent system based on the six basic units:

metre	m	ampere	A
kilogramme	kg	degree Kelvin	°K
second	s	candela	cd

the name *International System of Units* has been recommended by the Conférence Générale des Poids et Mesures in 1960. The units of this system are called: *SI-units*

7. The ***mole.***

In the field of *chemical and molecular physics*, in addition to the basic quantities defined above having units defined by the Conférence Générale des Poids et Mesures, *amount of substance* is also treated as a basic quantity. The recommended basic unit is the mole, symbol: mol. The mole is defined as the amount of substance of a system, which contains the same number of molecules (or ions, or atoms, or electrons, as the case may be), as there are atoms in exactly 12 gramme of the pure carbon nuclide ^{12}C.

9.2 Other units.

l	angström; *angström*	Å
σ	barn; *barn* ($= 10^{-24}$ cm^2)	b
V	litre; *litre*	l
t, τ, $T_{\frac{1}{2}}$	minute; *minute*	min
t, τ, $T_{\frac{1}{2}}$	hour; *heure*	h
t, τ, $T_{\frac{1}{2}}$	day; *jour*	d
t, τ, $T_{\frac{1}{2}}$	year; *année*	a
p	atmosphere; *atmosphère*	atm
E	kilowatt-hour; *kilowatt-heure*	kWh
Q	calorie; *calorie*	cal
E ,Q	electronvolt; *électronvolt*	eV
m	tonne; *tonne* ($= 1000$ kg)	t
m_a	(unified) atomic mass unit; *unité de masse atomique* (*unifiée*)	u
p	bar; *bar* ($= 10^6$ dyn/cm^2)	bar
A	curie, *curie*	Ci

Remark: The (unified) atomic mass unit is defined as $\frac{1}{12}$th of the mass of an atom of the ^{12}C nuclide.

APPENDIX*). SYSTEMS OF QUANTITIES AND UNITS IN ELECTRICITY AND MAGNETISM.

The CGS unit system with three basic units and the MKSA unit system with four basic units correspond respectively to two different sets of equations in the field of electricity and magnetism, which are developed starting from three and from four basic quantities respectively. These systems are denoted as three and four "dimensional" systems of equations respectively.

1. Systems of equations with 3 basic quantities.

Three distinct sets of equations with three basic quantities**) have been developed in the field of electricity and magnetism. These are:

(1.a) *The "electrostatic system" of equations*, defining the electric charge on the basis of Coulomb laws for the force between two electric charges, by taking the permittivity in vacuo equal to a dimensionless quantity, the number unity.

(1.b) *The "electromagnetic system" of equations*, defining the electric current on the basis of the interaction law for the force between two electric current elements, by taking the permeability in vacuo equal to a dimensionless quantity, the number unity.

(1.c) *The "symmetrical system" or Gaussian system of equations*, using the electric quantities from system (1.a) and the magnetic quantities from system (1.b). As a result of combining the two sets of quantities the velocity of light in vacuo appears explicitly in some of the equations interrelating electric and magnetic quantities.

The equations in these three systems are usually written in the *"non-rationalized"* form, which is called "non-rationalized," because in these equations often factors 2π or 4π appear in situations not involving circular or spherical symmetry respectively. These equations are sometimes written in a *"rationalized"* form, in which these factors appear only in those equations, where they could be expected from the geometry of the system. When three dimensional equations are used (e.g. in theoretical physics), one commonly uses those of the *non-rationalized symmetrical system.*

2. Systems of equations with 4 basic quantities.

In the equations with four basic quantities at least one quantity of electric or magnetic nature is included in the basic set. In such a system the permittivity and the permeability in vacuo appear explicitly as physical quantities with dimension in the relevant equations.

* The S.U.N. commission, after reproducing in the previous chapters all the recommendations on symbols, units and nomenclature approved by the I.U.P.A.P., gives in this Appendix some factual information about existing systems of quantities and units in the field of electricity and magnetism.

** Often length, time and mass are chosen as basic quantities, but also other choices, e.g. length, time and energy or length, time and force have been used.

APPENDIX*). SYSTEMS OF QUANTITIES AND UNITS IN ELECTRICITY AND MAGNETISM (Continued)

Two different sets of equations are in use:

(2.a) The *"non-rationalized system" of equations*, in which the factors 4π and 2π often appear at unexpected places.

(2.b) The *"rationalized system" of equations*, in which these factors only appear in those equations, where they could be expected from the geometry.

When four-dimensional equations are used, one commonly writes these equations in the rationalized form (2.b).

Some characteristic expressions of the non rationalized three-dimensional "symmetrical system" (1.c) and the corresponding four-dimensional equations in the non-rationalized form (2.a) and the rationalized form (2.b) are given in the table. The quantities of the three-dimensional "symmetrical system" of equations (1.c) have been indicated with an asterisk (*), those of the non-rationalized four-dimensional equations (2.a) with a prime ('), as far as they are different from those of the system (2.b).

Non-rationalized symmetric system with 3 basic quantities	Non-rational. system with 4 basic quantities	Rationalized system with 4 basic quantities
$c \operatorname{rot} \boldsymbol{E}^* = -\partial \boldsymbol{B}^*/\partial t$	$\operatorname{rot} \boldsymbol{E} = -\partial \boldsymbol{B}/\partial t$	$\operatorname{rot} \boldsymbol{E} = -\partial \boldsymbol{B}/\partial t$
$\operatorname{div} \boldsymbol{D}^* = 4\pi\rho$	$\operatorname{div} \boldsymbol{D}' = 4\pi\rho$	$\operatorname{div} \boldsymbol{D} = \rho$
$\operatorname{div} \boldsymbol{B}^* = 0$	$\operatorname{div} \boldsymbol{B} = 0$	$\operatorname{div} \boldsymbol{B} = 0$

$r_e = e^{*2}/mc^2$	$r_e = e^2/\epsilon_0' mc^2$	$r_e = e^2/4\pi\epsilon_0 mc^2$

Remark on rationalization:

The basis of these considerations in which the rationalization is connected with the writing of the equations between physical quantities is in agreement with the resolution accepted by the I.U.P.A.P. in 1951 in Copenhagen:

"The General Assembly of the Union of Physics considers that, in the case that the equations are rationalized, the rationalization should be effected by the introduction of new quantities."

("L'Assemblée Générale de l'Union de Physique considère que, dans le cas où les équations sont rationalisées, la rationalisation doit être obtenue par l'introduction de grandeurs nouvelles.")

3. CGS system of units.

(3.a) The *electrostatic CGS system of units* forms a coherent system of units in combination with the three-dimensional "electrostatic system" of equations (1.a).

(3.b) The *electromagnetic CGS system of units* forms a coherent system of units in combination with the three-dimensional "electromagnetic system" of equations (1.b).

(3.c) The *mixed CGS system of units*, called *Gaussian units*, consisting of the set of electric units of the electrostatic CGS system on the one hand and the set of magnetic units of the electromagnetic CGS system on the other hand, form together also a coherent system of units, when used in combination with the three-dimensional "symmetrical system" of equations (1.c).

4. MKSA system of units.

The MKSA system of units forms a coherent system of units in either of the four-dimensional systems of equations mentioned under 2.

The MKSA system is, however, most commonly used together with the rationalized (four-dimensional) equations (2.b).

5. centimetre-gramme-second-franklin system and centimetre-gramme-second-biot system

Several investigators have pointed out over many years the advantages, which result from the use of the four-dimensional equations, i.e. equations with four basic quantities from which at least one is of electrical nature. These advantages are partly of a didactical nature, but many investigators consider the usage of four basic quantities also important for developing a clear representation of the field of electricity and magnetism.

It has often been considered as a disadvantage that the transition from the three- to the four-dimensional system of equations should be tied to the transition from the CGS system of units to the MKSA system of units as explained under 3. and 4. which as a consequence leads to a change in the numerical value of many well known physical quantities.

APPENDIX*). SYSTEMS OF QUANTITIES AND UNITS IN ELECTRICITY AND MAGNETISM (Continued)

For that reason several investigators have advocated the introduction of a four-dimensional system of units, which is a generalization of the CGS system. This unit-system is chosen so that to any unit of the CGS system (with three basic units) there corresponds one particular unit of this "generalized CGS system" (with four basic units), such that the *numerical* values of the physical quantities in the field of electricity are invariant.

The introduction of such a "generalized CGS system" has the advantage that the relation between the units of this "generalized CGS system" and the units of the MKSA system can be expressed by ordinary conversion equations.

The use of the four-dimensional system of equations (with four basic quantities) accompanied by the usage of such a "generalized CGS system" of units (with four basic units) is therefore of advantage as an intermediate representation in this period of coexistence of the CGS system and the MKSA system, where transitions from one system to the other often have to be made.

As a result of all these considerations the General Assembly of the IUPAP, Copenhagen, 1951, approved by its resolution 5 the introduction of the following two "generalized CGS systems" based on four basic units:

(5.a) The system with the *centimetre, gramme, second* and the charge corresponding to one *electrostatic unit*, as basic units, being a 4-dimensional generalization of the electrostatic CGS system (3.a)

(5.b) The system with the *centimetre, gramme second* and the current corresponding to one *electromagnetic unit* or deca-ampere, as basic units, being a 4-dimensional generalization of the electromagnetic CGS system (3.b)

In practical applications of these systems it is of advantage to indicate the *basic electrical unit* in each of these two systems with a name and symbol.

The name franklin was proposed in 1941 for the electrostatic unit of electric charge considered as a basic unit of the system (5.a). The franklin, symbol: Fr, is thus defined as:

The *franklin* is that charge, which exerts on an equal charge at a distance of 1 centimetre in vacuo a force of 1 dyne.

According to this definition 1 franklin = $(10/\zeta)$ coulomb, where $\zeta = 2.997925 \times 10^{10}$ is the numerical value of the velocity of light in vacuum, measured in cm/s.

For the electromagnetic unit of electric current, considered as a basic unit of the system (5.b), the name biot has been used. The biot, symbol: Bi, is thus defined as:

The *biot* is that constant current intensity, which, when maintained in two parallel infinitely long rectilinear conductors of infinite length and of negligible circular section, placed at a mutual distance of 1 centimetre apart in vacuo, would produce between these conductors a force of 2 dyne per centimetre length.

According to this definition 1 biot = 10 ampere*).

These unit systems (5.a) and (5.b) are referred to as cm-g-s-Fr system and cm-g-s-Bi system respectively.

The definitions of the franklin in the system (5.a) and that of the biot in the system (5.b) which closely correspond to the electrostatic CGS unit of charge and the electromagnetic CGS unit of current respectively, ensure that the quantities of the *non-rationalized* four-dimensional system of equations (second column, table p. 27), when expressed in these units, have the same numerical value as the corresponding quantities of the non-rationalized three-dimensional system of equations (first column, table p. 27), when expressed in the corresponding CGS units.

Some of the units of the three-dimensional CGS system and the corresponding units of the two four-dimensional systems are given in the table:

	three-dimensional unit of mixed CGS system		corresponding four-dimensional unit of generalized CGS system
Q^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{\frac{1}{2}}$	Q	Fr
I^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{\frac{1}{2}}\,\mathrm{s}^{-1}$	I	Fr/s
V^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{-\frac{1}{2}}$	V	erg/Fr
E^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{-\frac{3}{2}}$	E	dyn/Fr
D^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{-\frac{1}{2}}$	D'	$\mathrm{Fr/cm^2}$
C^*	cm	C	$\mathrm{Fr^2/erg}$
ϵ_r	1	ϵ'	$\mathrm{Fr^2/erg \cdot cm}$
B^*	G	B	$\mathrm{dyn/Bi \cdot cm}$
H^*	Oe	H'	Bi/cm
μ_r	1	μ'	$\mathrm{dyn/Bi^2}$

* The wording of this definition is, except for the replacement of 1 metre by 1 centimetre and of 2 newton per metre by 2 dyne per centimetre, the exact translation of the original french text defining the ampere (C. R. 9me Conf. Gén. Poids et Mesures, 1948, p. 49).

ALPHABET TABLE

Greek letter	Greek name	English equivalent	RUSSIAN letter	English equivalent
Α α	Alpha	(à)	А а	(ä)
Β β	Beta	(b)	Б б	(b)
Γ γ	Gamma	(g)	В в	(v)
Δ δ	Delta	(d)	Г г	(g)
Ε ε	Epsilon	(e)	Д д	(d)
Ζ ζ	Zeta	(z)	Е е	(ye)
Η η	Eta	(ā)	Ж ж	(zh)

AMERICAN STANDARD ABBREVIATIONS FOR SCIENTIFIC AND ENGINEERING TERMS

Reproduced by permission of The American Society of Mechanical Engineers

Introductory Notes

Scope and Purpose

1. The Executive Committee of the Sectional Committee on Scientific and Engineering Symbols and Abbreviations has made the following distinction between symbols and abbreviations: Letter symbols are letters used to represent magnitudes of physical quantities in equations and mathematical formulas. Abbreviations are shortened forms of names or expressions employed in texts and tabulations, and should not be used in equations.

Fundamental Rules

2. Abbreviations should be used sparingly in text and with due regard to the context and to the training of the reader. Terms denoting units of measurement should be abbreviated in the text only when preceded by the amounts indicated in numerals; thus "several inches," "one inch," "12 in." In tabular matter, specifications, maps, drawings, and texts for special purposes, the use of abbreviations should be governed only by the desirability of conserving space.

3. Short words such as ton, day, and mile should be spelled out.

4. Abbreviations should not be used where the meaning will not be clear. In case of doubt, spell out.

5. The same abbreviation is used for both singular and plural, as "bbl" for barrel and barrels.

6. The use of conventional signs for abbreviations in text is not recommended; thus "per," not /; "lb," not #; "in," not ". Such signs may be used sparingly in tables and similar places for conserving space.

7. The period should be omitted except in cases where the omission would result in confusion.

8. The letters of such abbreviations as ASA should not be spaced (not A S A).

9. The use in text of exponents for the abbreviations of square and cube and of the negative exponents for terms involving "per" is not recommended. The superior figures are usually not available on the keyboards of typesetting and linotype machines and conposition is therefore delayed. There is also the liklihood of confusion with footnote reference numbers. These shorter forms are permissible in tables and are sometimes difficult to avoid in text.

10. A sentence should not begin with a numeral followed by an abbreviation. Abbreviations for names of units are to be used only after numerical values. such as 25 ft or 110 v.

Abbreviations*

absolute	abs
acre	spell out
acre-foot	acre-ft
air horsepower	air hp
alternating-current (as adjective)	a-c
ampere	amp
ampere-hour	amp-hr
amplitude, an elliptic function	am.
Angstrom unit	A
antilogarithm	antilog
atmosphere	atm
atomic weight	at. wt
average	avg
avoirdupois	avdp
azimuth	az or α
barometer	bar.
barrel	bbl
Baumé	Bé
board feet (feet board measure)	fbm
boiler pressure	spell out
boiling point	bp
brake horsepower	bhp
brake horsepower-hour	bhp-hr
Brinell hardness number	Bhn
British thermal unit[1]	Btu or B
bushel	bu
calorie	cal
candle	c
candle-hour	c-hr
candlepower	cp
cent	c or ¢
center to center	c to c
centigram	cg
centiliter	cl
centimeter	cm
centimeter-gram-second (system)	cgs
chemical	chem
chemically pure	cp
circular	cir
circular mils	cir mils
coefficient	coef
cologarithm	colog
concentrate	conc
conductivity	cond
constant	const
continental horsepower	cont hp
cord	cd
cosecant	csc
cosine	cos
cosine of the amplitude, an elliptic function	cn
cost, insurance, and freight	cif
cotangent	cot
coulomb	spell out
counter electromotive force	cemf
cubic	cu
cubic centimeter	cu cm, cm^3 (liquid, meaning milliliter. ml)
cubic foot	cu ft
cubic feet per minute	cfm
cubic feet per second	cfs
cubic inch	cu in.
cubic meter	cu m or m^3
cubic micron	cu μ or cu mu or μ^3
cubic millimeter	cu mm or mm^3
cubic yard	cu yd
current density	spell out
cycles per second	spell out or c
cylinder	cyl
day	spell out
decibel	db
degree[1]	deg or °
degree centigrade	C
degree Fahrenheit	F
degree Kelvin	K
degree Réaumur	R
delta amplitude, an elliptic function	dn
diameter	diam
direct-current (as adjective)	d-c
dollar	$
dozen	doz
dram	dr

* These forms are recommended for readers whose familiarity with the terms used makes possible a maximum of abbreviations. For other classes of readers editors may wish to use less contracted combinations made up from this list. For example, the list gives the abbreviation of the term "feet per second" as "fps." To some readers ft per sec will be more easily understood. [1] Abbreviation recommended by the A.S.M.E. Power Test Codes Committee. B = 1 Btu, kB = 1000 Btu, mB = 1,000,000 Btu. The A.S.H. &V.E. recommends the use of Mb = 1000 Btu and Mbh = 1000 Btu per hr.

AMERICAN STANDARD ABBREVIATIONS (Continued)

efficiency	eff
electric	elec
electromotive force	emf
elevation	el
equation	eq
external	ext
farad	spell out or f
feet board measure (board feet)	fbm
feet per minute	fpm
feet per second	fps
fluid	fl
foot	ft
foot-candle	ft-c
foot-Lambert	ft-L
foot-pound	ft-lb
foot-pound-second (system)	fps
foot-second (see cubic feet per second)	
franc	fr
free aboard ship	spell out
free alongside ship	spell out
free on board	fob
freezing point	fp
frequency	spell out
fusion point	fnp
gallon	gal
gallons per minute	gpm
gallons per second	gps
grain	spell out
gram	g
gram-calorie	g-cal
greatest common divisor	gcd
haversine	hav
hectare	ha
henry	h
high-pressure (adjective)	h-p
hogshead	hhd
horsepower	hp
horsepower-hour	hp-hr
hour	hr
hour (in astronomical tables)	h
hundred	C
hundredweight (112 lb)	cwt
hyperbolic cosine	cosh
hyperbolic sine	sinh
hyperbolic tangent	tanh
inch	in.
inch-pound	in-lb
inches per second	ips
indicated horsepower	ihp
indicated horsepower-hour	ihp-hr
inside diameter	ID
intermediate-pressure (adjective)	i-p
internal	int
joule	j
kilocalorie	kcal
kilocycles per second	kc
kilogram	kg
kilogram-calorie	kg-cal
kilogram-meter	kg-m
kilograms per cubic meter or kg/m^3	kg per cu m
kilograms per second	kgps
kiloliter	kl
kilometer	km
kilometers per second	kmps
kilovolt	kv
kilovolt-ampere	kva
kilowatt	kw
kilowatthour	kwhr
lambert	L
latitude	lat or ϕ
least common multiple	lcm
linear foot	lin ft
liquid	liq
lira	spell out
liter	l
logarithm (common)	log
logarithm (natural)	$\log_e$ or ln
longitude	long. or λ
low-pressure (as adjective)	l-p
lumen	l*
lumen-hour	l-hr*
lumens per watt	lpw
mass	spell out
mathematics (ical)	math
maximum	max
mean effective pressure	mep
mean horizontal candlepower	mhcp
megacycle	spell out
megohm	spell out
melting point	mp
meter	m
meter-kilogram	m-kg
mho	spell out
microampere	μa or mu a
microfarad	μf
microinch	μin.
micromicrofarad	$\mu\mu$f
micromicron	$\mu\mu$ or mu mu
micron	μ or mu
microvolt	μv
microwatt	μw or mu w
mile	spell out
miles per hour	mph
miles per hour per second	mphps
milliampere	ma
milligram	mg
millihenry	mh
millilambert	mL
milliliter	ml
millimeter	mm
millimicron	mμ or m mu
million	spell out
million gallons per day	mgd
millivolt	mv
minimum	min
minute	min
minute (angular measure)	′
minute (time)(in astronomical tables)	m
mole	spell out
molecular weight	mol. wt
month	spell out
National Electrical Code	NEC
ohm	spell out or Ω
ohm-centimeter	ohm-cm
ounce	oz
ounce-foot	oz-ft

[1] There are circumstances under which one or the other of these forms is preferred. In general the sign ° is used where space conditions make it necessary, as in tabular matter, and when abbreviations are cumbersome, as in some angular measurements, i.e., 59° 23′ 42″. In the interest of simplicity and clarity the Committee has recommended that the abbreviation for the temperature scale, F, C, K, etc., always be included in expressions for numerical temperatures, but, wherever feasible, the abbreviation for "degree" be omitted; as 69 F.

* The International Commission on Illumination has changed the symbol for lumen to lm, and the symbol for lumen-hour to lm-hr. This nomenclature is used in American Standard for Illuminating Engineering Nomenclature and Photometric Standards (ASA Z7.1–1942).

AMERICAN STANDARD ABBREVIATIONS (Continued)

ounce-inch	oz-in.
outside diameter	OD
parts per million	ppm
peck	pk
penny (pence)	d
pennyweight	dwt
per	(See Fundamental Rules)
peso	spell out
pint	pt
potential	spell out
potential difference	spell out
pound	lb
pound-foot	lb-ft
pound-inch	lb-in.
pound sterling	£
pounds per brake horsepower-hour	lb per bhp-hr
pounds per cubic foot	lb per cu ft
pounds per square foot	psf
pounds per square inch	psi
pounds per square inch absolute	psia
power factor	spell out or pf
quart	qt
radian	spell out
reactive kilovolt-ampere	kvar
reactive volt-ampere	var
revolutions per minute	rpm
revolutions per second	rps
rod	spell out
root mean square	rms
secant	sec
second	sec

volt	v
volt-ampere	va
volt-coulomb	spell out
watt	w
watthour	whr
watts per candle	wpc
week	spell out
weight	wt
yard	yd
year	yr

ABBREVIATIONS OF COMMON UNITS OF WEIGHT AND MEASURE

From NBS Miscellaneous Publication No. 233.

Spelling and Abbreviations of Units

The spelling of the names of units as adopted by the National Bureau of Standards is that given in the list below. The spelling of the metric units is in accordance with that given in the law of July 28, 1866, legalizing the metric system in the United States.

Following the name of each unit in the list below is given the abbreviation which the Bureau has adopted. Attention is particularly called to the following principles:

1. The period is omitted after all abbreviations of units, except where the abbreviation forms an English word.

2. The exponents "^{2}" and "^{3}" are used to signify "square" and "cubic," respectively, instead of the abbreviations "sq" or "cu," which are, however, frequently used in technical literature for the United States customary units. In conformity with this principle the abbreviation for cubic centimeter is "cm^3" (instead of "cc" or "c cm"). The term "cubic centimeter," as used in chemical work, is, in fact, a misnomer, since the unit actually used is the "milliliter" of which "ml" is the correct abbreviation.

3. The use of the same abbreviation for both singular and plural is recommended. This practice is already established in expressing metric units and is in accordance with the spirit and chief purpose of abbreviations.

4. It is also suggested that, unless all the text is printed in capital letters, only small letters be used for abbreviations, except in such case as, A for angstrom, etc., where the use of capital letters is general.

LIST OF THE MOST COMMON UNITS OF WEIGHT AND MEASURE AND THEIR ABBREVIATIONS

Unit	Abbreviation	Unit	Abbreviation
acre	acre	kiloliter	kl
angstrom	A	kilometer	km
are	a	link	li
avoirdupois	avdp	liquid	liq
barrel	bbl	liter	liter
board foot	fbm	meter	m
bushel	bu	metric ton	t
carat	c	microgram*	μg
centare	ca	microinch	μin.
centigram	cg	microliter*	μl
centiliter	cl	micron	μ
centimeter	cm	mile	mi
chain	ch	milligram	mg
cubic centimeter	cm^3	milliliter	ml
cubic decimeter	dm^3	millimeter	mm
cubic dekameter	dkm^3	millimicron	mμ
cubic foot	ft^3	minim	min *or* ♏
cubic hectometer	hm^3	ounce	oz
cubic inch	$in.^3$	ounce, apothecaries	oz ap *or* ℥
cubic kilometer	km^3	ounce, avoirdupois	oz avdp
cubic meter	m^3	ounce, fluid	fl oz
cubic mile	mi^3	ounce, troy	oz t
cubic millimeter	mm^3	peck	pk
cubic yard	yd^3	pennyweight	dwt
decigram	dg	pint	pt
deciliter	dl	pound	lb
decimeter	dm	pound, apothecaries	lb ap
decistere	ds	pound, avoirdupois	lb avdp
dekagram	dkg	pound, troy	lb t
dekaliter	dkl	quart	qt
dekameter	dkm	rod	rd

* Stricken or struck bushel. A heaped bushel for apples of 2747.715 cu. inches was established by the U.S. Court of Customs Appeals on Feb. 15, 1912. A heaped bushel equal to 1¼ stricken bushels is also known.

** This is the calorie as defined by the U.S. National Bureau of Standards and is equal to 4.18400 joules.

DEFINED VALUES AND EQUIVALENTS

Meter	**(m)**	1 650 763.73 wave lengths in vacuo of the unperturbed transition $2p_{10} - 5d_5$ in ^{86}Kr
Kilogram	**(kg)**	mass of the international kilogram at Sèvres, France
Second	**(s)**	1/31 556 925.974 7 of the tropical year at 12^h ET, 0 January 1900
Degree Kelvin	**(°K)**	defined in the thermodynamic scale by assigning 273.16 °K to the triple point of water (freezing point, 273.15 °K = 0 °C)
Unified atomic mass unit	*(u)*	1/12 the mass of an atom of the ^{12}C nuclide
Mole	**(mol)**	amount of substance containing the same number of atoms as 12 g of pure ^{12}C
Standard acceleration of free fall	**(g_n)**	9.806 65 m s^{-2}, 980.665 cm s^{-2}
Normal atmospheric pressure	**(atm)**	101 325 N m^{-2}, 1 013 250 dyn cm^{-2}
Thermochemical calorie	**(cal_{th})**	4.1840 J, 4.1840×10^7 erg
International Steam Table calorie	**(cal_{IT})**	4.1868 J, 4.1868×10^7 erg
Liter	**(l)**	0.001 m^3, 1000 cm^3 (recommended by GCWM, 1964)
Inch	**(in)**	0.0254 m. 2.54 cm
Pound (avdp)	**(lb)**	0.453 592 37 kg, 453.592 37 g

RECIPROCALS OF NUMBERS

For given values of N the following table contains the corresponding values of 1000/N, N + 273.15 and 1000/N + 273.15. For convenience of converting from the Kelvin temperature scale to the Celsius temperature scale the table begins at −273.15. Thus for N one may read °C, and for N + 273.15 one may read °K.

N	1000/N	N + 273.15	1000/N + 273.15

DIMENSIONLESS GROUPS

John P. Catchpole and George Fulford

Reprinted from Industrial & Engineering Chemistry, Vol. 58, No. 3, pp. 47 to 60. Copyright 1966 by the American Chemical Society and reprinted by permission of the copyright owners and the authors.

Dimensionless groups are frequently generated in the analysis of a complex engineering problem. The more common groups thus generated are easily recognized, while the less common ones are not. Unless the less common existing groups are recognized, an already named group could unknowingly be renamed. Table A provides a tool that may be used to avoid this occurrence, by listing the groups by the variables of which they consist. These variables—i.e., length, density, diffusivity, viscosity, etc.—are further subdivided into their exponents to which they are raised in the groups in question. Thus, Reynolds number is listed under the exponent +1 for the variables, length, fluid velocity, and density, and the exponent −1 for viscosity.

To illustrate the use of the tables in the analysis of a problem, the group $(kE/\eta\sigma T^3)$ might be generated in the solution of a complex heat transfer problem. From Table A the groups containing the constituent variables are checked and the groups are listed:

Thermal conductivity	(k^{+1})	**F11, L7, R1**
Modulus of elasticity	(E^{+1})	**C1, E13, R1**
Stefan-Boltzmann coefficient	(η^{-1})	**R1, T6**
Surface tension	(σ^{-1})	**B9, C3, E8, L6, R1, W1**
Temperature	(T^{-3})	**R1, T6**

It is immediately apparent that the only group common to all the categories listed is the Radiation number, **R1**, which is equivalent to the previously unidentified group.

The symbol assigned to a dimensionless group is usually the first two letters of its names. Several groups, however, have nonstandard symbols, particularly in the groups which are named after persons. These symbols are listed in the nomenclature.

NOMENCLATURE

a	= annulus or clearance width, L
A	= area, L^2
A^*	= cooling area/unit volume, $1/L$
b	= bearing breadth, L
B	= groups **B6, B11**
c	= specific heat, L^2/θ^2T
c_A	= concentration, M/L^3
c_b	= specific vapor capacity (mass/unit mass/unit pressure change), $L\theta^2/M$
c_d, c_D	= group **D13**
c_f	= group **R9**
c_H	= group **H4**
c_m	= mass capacity, L^3/M
c_p, c_v	= specific heats at constant pressure and volume, L^2/θ^2T
c_Q	= heat capacity, L^2/θ^2T
c_Q	= group **F9**
c_S	= group **S11**
C	= group **C10**, dimensional concentration, M/L^3
C_a	= groups **C11, C4**
d	= diameter, L
d_e	= equivalent diameter (of particles, etc.), L
d_h	= hydraulic diameter, L
D	= diffusivity (molecular, unless noted otherwise), L^2/θ
D_{AB}	= binary bulk diffusion coefficient, L^2/θ
D_{KA}	= Knudsen diffusion coefficient, L^2/θ
e	= voidage; porosity (−)
e^*	= surface emissivity (−)
E	= modulus of elasticity, $M/L\theta^2$
E_a	= activation energy, L^2/θ^2
E_b	= bulk modulus, $M/L\theta^2$
f	= frequency, $1/\theta$, or Group **F1**
$f(M)$	= group **F11**
F	= force, ML/θ^2
F_b	= force per unit length of bearing, M/θ^2
$F(M)$	= group **F6**
F_R	= resistance force in flow, ML/θ^2
g	= acceleration due to gravity, L/θ^2
G	= mass velocity (mass flux density; mass transfer coefficient), $M/\theta L^2$
h	= heat transfer coefficient, $M/T\theta^3$
h_c	= convective heat transfer coefficient, $M/T\theta^3$
H	= energy change per unit mass (= $g \times$ head), L^2/θ^2
H'	= fluid head, L
H_e	= field strength, $Q/L\theta$
H_0	= homochronicity number
$I(M)$	= group **F8**
j	= heat liberated per unit volume per unit time, $M/L\theta^3$
j_H, j_M	= groups **J2, J3**
J	= average free path/average velocity, θ, or group **L6**
k	= thermal conductivity, $ML/T\theta^3$
k_c	= mass transfer coefficient, L/θ
K	= groups **K2, K10, N5**
K_1	= group **A4**
$\bar{K}_E$	= group **E4**
K_F	= group **C2**
K_P	= group **P13**
K_Q	= group **H5**
K_r	= group **E11**
$\bar{K}_\theta$	= group **A1**
$\bar{K}_E$	= group **E4**
$\bar{K}_r$	= group **E12**
$\bar{K}_{rE}$	= group **E13**
$\bar{K}_s$	= group **R1**
$\bar{K}_\sigma$	= group **C1**
$\bar{K}_{\sigma\theta}$	= group **C2**
L	= characteristic dimension (except as noted), L
L_m	= distance from midpoint to surface, L
m_T	= group **T3**
M	= group **M10**
M_H	= group **H2**
n	= concentration, wt./wt. (−)
n^*	= specific mass content, mass/mass (−)
n_m	= moisture content, wt./wt. bone dry gas (−)
N	= rate of rotation, $1/\theta$, and groups **M3, N4**
N_{Bo}	= groups **B7, B8**
N_c	= group **C5**
N_{cv}	= group **C10**
N_D	= groups **D7, D14**
N_E	= group **E1**
N_F	= group **F4**
N_H	= groups **H1, H9**
N_K	= group **K1**
N_{KnA}	= Knudsen number for diffusion (see Addendum)
N_l	= group **N2**
N_P	= group **P7**
N_{rf}	= group **R7**
N_{s1}	= group **S8**
N_{s2}	= group **S9**
N_T	= group **N9**
P	= pressure, $M\ L\theta^2$
P	= plasticity number (see Addendum)
p_b	= bearing pressure, $M\ L\theta^2$
p_s	= static pressure, $M\ L\theta^2$
p_v	= vapor pressure, $M\ L\theta^2$
p_σ	= capillary pressure, $M/L\theta^2$
Δp_F	= frictional pressure drop, $M/L\theta^2$
q	= heat flux (heat flow/unit time), ML^2/θ^3
q^*	= heat flux density (heat flux/unit area), M/θ^3
Q	= heat liberated/unit mass, L^2/θ^2
r	= latent heat of phase change, L^2/θ^2
r_v	= heat of vaporization, L^2/θ^2
R	= radius, L
R_H	= hydraulic radius, L
R_2'	= group **R5**
R_M	= group **M7**
R_V	= group **V3**
$\mathfrak{R}$	= gas constant, L^2/θ^2T
s	= humid heat, L^2/θ^2T
S	= particle area/particle volume, L^2/L^3, and group **M6**
$\overline{St}$	= group **S14**
t	= temperature, T
T	= absolute temperature, T
Δt, ΔT	= temperature difference, T
U^+	= group **P10**

DIMENSIONLESS GROUPS (Continued)

U = reaction rate, $M/L^3\theta$
v_s = velocity of surface (solid), L/θ
V = fluid velocity, L/θ, and group **V1**
V_A = velocity of Alfven magnetic waves, L/θ
V_f = volumetric flow rate, L^3/θ
V_l = velocity of light, L/θ
V_m = mass flow rate, M/θ
V_s = velocity of sound, L/θ
w = circumferential velocity, L/θ
W = volume of system, L^3
W^* = gross volume, L^3
x = entry length; distance from entrance, L
y^+ = group **P11**
Z = group **O2**
α = thermal diffusivity (temperature conductivity), L^2/θ
β = coefficient of bulk expansion, $1/T$, and group **D12**
β^* = Dufour coefficient, T
γ = specific gravity ($^-$) and group **R3**
$\dot{\gamma}$ = rate of shear, $1/\theta$
Γ = rate of change of temperature of medium, T/θ
δ = Soret or thermogradient coefficient, $1\ T$, and group **D11**
Δ = difference in quantity
ϵ = height of roughness, L and group **A3**
ϵ_D = eddy mass diffusivity, L^2/θ
ζ = diffusion tortuosity ($^-$)
η = radiation coefficient (Stefan-Boltzmann coefficient), $M\ T^4\theta^3$
θ = time, θ
θ_r = relaxation time, θ
λ = mean free path, L
μ = dynamic viscosity, $M/L\theta$
μ_e = magnetic permeability, ML/Q^2
μ_p = rigidity coefficient, $M/L\theta$
ξ = permeability, L^2
π = 3.1416. . . .
Π = power to agitator or impeller, ML^2/θ^3
ρ = density, M/L^3
ρ_n = group **P3**
σ = surface tension, M/θ^2 and group **S12**
σ_c = group **C6**
σ_e = electrical conductivity, $Q^2\theta/L^3M$
σ_t = group **T4**
τ = group **T8**
τ_w = wall shear stress, $M/L\theta^2$
τ_y = yield stress, $M/L\theta^2$
φ = group **D9**
ψ = groups **N8, P14, R10**
ω = angular velocity (of fluid, unless noted otherwise), $1/\theta$
Ω = mass transfer potential (concn.), M/L^3
— (bar over) = mean value
N.B.: $(F) = \left(\frac{ML}{\theta^2}\right)$; $(H) = \left(\frac{ML^2}{\theta^2}\right)$

TABLES FOR IDENTIFYING DIMENSIONLESS GROUPS

TABLE A

PHYSICAL PROPERTIES
General Physical Properties

Parameter	Symbol	Dimensions	Exponent	Group
Coefficient of bulk expansion	β	$1/T$	-1	**E4, 12, G2**
			$+1$	**G5, R5, K9, 6**
Density	ρ	M/L^3	-2	**M1**
			-1	**A1, B1, 10, C1, 2, 6, D3, 13, E3, 9, 10, 13, F1, 11, H5, J1, K4, K10, L7, M3, 6, N2, 3, 4, P7, 9, R10, 13, S4, 13, 15**
			$-\frac{2}{3}$	**C9, J3**
			$-\frac{1}{2}$	**E2, L11, O2, P13**
			$+\frac{1}{3}$	**J3, K5, 53**
			$+\frac{1}{2}$	**D10, G3, P10, 11, R4, W2**
			$+\frac{2}{3}$	**F2, N8, S2**
			$+1$	**A5, B1, B6, 9, C5, 7, D5, 7, 13, E4, 6, 7, 8, H6, 11, J1, 3, 4, K1, L9, P1, R5, 11, 13, S17, T1, T6, V1, W1, W3**
			$+2$	**C10, G1, 5, K9, R5, 6, T2**
Density gradient	$d\rho/dL$	M/L^4	$+1$	**R13**
Diffusivity (molecular unless noted otherwise)	D, a_m, ϵ_D	L^2/θ	-1	**B5, B7[4], D2, K4[1], K7[2], L2, 7, 10, N7, P2, P9, S4, 13**
			$-\frac{2}{3}$	**J3**
			$-\frac{1}{2}$	**T3**
			$+1$	**D12, F12[1], K7[3], L2[4], L9[1]**
Diffusivity (surface)	D_s	ML/θ^2	$+1$	**S18**
Diffusion tortuosity	ζ	.....	-1	**K7**
Molecular weight	M	.....	-1	**D14, K9, S6**
			$+1$	**D14**
Permeability (packed bed)	k	L^2	$+\frac{1}{2}$	**L4**
Porosity (voidage)	e	.....	-1	**B4**
			$-\frac{1}{2}$	**L4**
			$+1$	**K7**

PHYSICAL PROPERTIES
General Physical Properties

Parameter	Symbol	Dimensions	Exponent	Group
Specific weight	γ	.....	$\pm\frac{1}{3}$	**F2**
Surface tension	σ	M/θ^2	-3	**C2**
			-2	**C1**
			-1	**B9, C3, 13, E8, L6, R1, W1, 3**
			$-\frac{1}{2}$	**D10, G3, O2, P13, R4, W2**
			$+1$	**M9, S17, 18**

[1] Coefficient of potential diffusion in mass transfer.
[2] Knudsen diffusion coefficient.
[3] Binary bulk diffusion coefficient.
[4] Effective diffusivity ($D + \epsilon_D$) (molecular + eddy transfer).

Electrical and Magnetic Properties

Current density	I	$Q/L^2\theta$	$+1$	**K10**
Electrical conductivity	σ_e	$Q^2\theta/L^3M$	-1	**E6**
			$+\frac{1}{2}$	**H2**
			$+1$	**L11, M3, 7**
Field strength	H_e	$Q/L\theta$	-2	**J4**
			$+1$	**H2, L11**
			$+2$	**K9, M3, 6, S6**
Magnetic permeability	μ_e	ML/Q^2	-1	**E5, J4**
			$+1$	**H2, M6, 7**
			$+\frac{3}{2}$	**L11**
			$+2$	**M3**
Voltage	E	$ML/Q\theta^2$	$+1$	**K10**

Thermal Properties

Humid heat	S	L^2/θ^2T	-1	**P15**
Latent heats of phase change	λ, r	L^2/θ^2	-1	**A3, E11, 12, 13, J1, K10, M1**
			$+1$	**B13, C9, K8, 11, N5**
Ratio of specific heats	γ	.....	$\pm\frac{1}{2}$	**L5**
Specific heat	C, c	L^2/θ^2T	-1	**B2, 13, D3, 15, E1, F11, J2, K8, 11, L7, M10, N5, R3, S13**
			$-\frac{1}{3}$	**J2**
			$+\frac{1}{3}$	**F6, 7, 8**

TABLE A (Continued)

Thermal Properties

Parameter	Symbol	Dimensions	Exponent	Group
Specific heat (*con't*)			$+\frac{2}{3}$	J2
			$+1$	A3, E4, 12, G4, J1, 4, L9, P1, 8, R3, 5, 6, 7
Surface emissivity	e^*	.....	-1	T6
Temperature conductivity (thermal diffusivity)	α	L^2/θ	-1	L9, P1, 12, R5
			$+1$	C13, L7, 10
Thermal conductivity	k or λ	$ML/T\theta^3$	-3	M1
			-2	R6
			-1	B4, 12, C7, 9, 10, D4, G4, K3, L9, N6, P1, 5, 8, R5, S14

Rheological and Elastic Behavior

Modulus of elasticity	E	$M/L\theta^2$	-1	C5, E4, H11
			$+1$	C1, E13, R1
			$+3$	A1
Rate of shear	$\dot{\gamma}$	$1/\theta$	$+1$	T8
Rigidity coefficient	μ_p	$M/L\theta$	-2	H6
			-1	B3
			-1	E5
Shear stress	τ	$M/L\theta^2$	$-\frac{1}{2}$	P10
			$+\frac{1}{2}$	P11
Viscosity (in all cases kinematic viscosity has been written as μ/ρ)	μ	$M/L\theta$	-2	A1, 5, G1, 5, K1, 9, S17, T2
			-1	B6, C10, D5, 7, E6, 7, H8, L1, 3, 9, O1, P4, 11, R5, 6, 11, S9, 19, T1, V1
			$-\frac{2}{3}$	F2, K5, N8
			$-\frac{1}{2}$	H2
			$-\frac{1}{3}$	S2, 3
			$+\frac{1}{2}$	E2
			$+\frac{2}{3}$	C9, J2, 3
			$+1$	B12, C3, 13, E3, 5, M1, O2, P8, 9, S4, 8, 15, T8
			$+2$	C1
			$+4$	C2
Viscosity (surface)	μ_s	M/θ	$+1$	S19
Yield stress	τ_y	$M/L\theta^2$	$+1$	B3, H6

LENGTHS, AREAS AND VOLUMES

Characteristic Linear Dimensions

(In all cases kinematic viscosity has been written as μ/ρ)

General characteristic linear dimension	Various	L	5	P7
			-3	F9, L1
			-2	D9, 12, E3, F11, 12, H4, 5, N2, 3, 4, O1, R9, S8, 9, 15
			1	B1, 10, E2, 5, 10, F1, 13, G4, H10, K6, L4, R6, 10, 15, 16, S6, 19, T5, W4
			$\frac{1}{2}$	B11, D7, F14, O2
			$+\frac{1}{2}$	R4, T1, W2
			$+1$	B3, 4, 5, 7, 10, C7, D1, 3, 5, 11, 13, E7, 10, F1, 2, 5, G3, H2, K3, 4, 6, 10, L3, 4, 9, 11, M1, 3, 7, N6, 7, 8, O1, P1, 2, 11, R8, 10, 11, 16, S2, 7, 14, 16, 17, 18, T3, W1
			$+\frac{3}{2}$	D7, H7, T1
			$+2$	B9, D2, 4, E8, H6, K9, O1, P4, 5, 12, S8, 9, V1
			$+3$	A5, C10, G1, 5, K1, R5

Characteristic Linear Dimensions

Parameter	Symbol	Dimensions	Exponent	Group
			$+4$	T2
			$+5$	R6
Dimension of agitator, impeller, etc.	Various	L	-5	P7
			-3	F9
			-2	D7, H4
			$+1$	D11, F15
			$+3$	W3
Film thickness	L_f	L	$+1$	N8
Furnace half-width	L	L	-1	T7
Larmor radius	L_L	L	$+1$	L4
Mean free path	λ	L	$+1$	K6
Particle dimension	d_e	L	-2	S15
			$+\frac{1}{2}$	F2
			$+3$	A5, G1
Pore or nozzle radius	R	L	$+1$	M12, T7
Reactor length	L	L	$+1$	B7
			-1	C3, L9
Thickness of liquid layer	L	L	$+1$	H2, L11
			$+2$	L9
			$+3$	R5
			$+4$	T2

Areas

Area	A	L^2	-1	D9, F6, 7, 8
			$+1$	B2
Area/unit volume	S, A^*	$1/L$	-1	B6
			$+1$	M11, 12

Volumes

Volume	.....	L^3	$+$	A5, H9, M11

TIMES AND FREQUENCIES

			-1	D8
Time	θ	θ	$+1$	D8, 12, E3, F11, 12, H1, 10, S15, T5
Frequency	f'	$1/\theta$	$+1$	H1, 10, S16, V1

TEMPERATURES AND CONCENTRATIONS (DRIVING FORCES)

Concentrations and Related Quantities

Dimensional concentration	C, c_A	M/L^3	-1	D1, 2, R2
			$-\frac{1}{2}$	T3
			$+1$	B10
Dimensionless concentration—e.g., wt./wt. inert material, etc.	n		1	P6
			$+1$	A4, K8
Mass capacity	C_m	L^3/M	-1	R2
Mole fraction	Y, Z		± 1	D14
Specific mass content, mass unit mass	n^*		-1	K4
Surface concentration	$1'$	M/L^2	$+1$	S18
Vapor capacity (porous body)	C_v	$L\theta^2/M$	$+1$	B13, R2

Temperatures, Temperature Differences

Temperature, temperature difference	T, ΔT	T	-3	R1*, T6*
			-1	A4, 6*, B12, 13, C4*, 7, 10, D3*, 4*, 15, E1, G2, 6*, K3, 8, 9, 11, L9, N5, P5*, 12*, R14*, S6
			$\frac{1}{2}$	L5
			$+\frac{1}{2}$	F6*, 7*, 8*
			$+1$	C4, G5, 6, J1, 4, L9, M1, P6, R5, 7, 14*
			$+3$	S14*
Rate of temperature change		T/θ	$+1$	P12

* Absolute temperature; others—temperature differences.

TABLE A (Continued)

VELOCITIES, RATES, FLUXES, TRANSFER COEFFICIENTS

Velocities

Parameter	Symbol	Dimensions	Exponent	Group
Angular velocity (rate of rotation)	N	$1/\theta$	-3	P7
			-2	H4, L1
			-1	F9, R15
			$-\frac{1}{2}$	E2
			$+1$	S8, 11, 12, T1
			$+2$	F15, T2, W3
Fluid velocity	V	L/θ	-3	H5
			-2	C6, 11, D13, E9, 10, F1, M6, N2, 3, 4, R7, 8, 9, 10
			-1	A2, B3, C12, 14, D1, 3, F10, H7, 8, K10, L3, M3, P4, S13, 16
			$+1$	A2, B6, 7, 11, C3, 12, 14, D5, 7, E5, 7, F10, 14, H10, K2, L5, 8, M2, 4, 7, P1, 2, 3, 10 R4, 11, 15, S1, 2, 3, T5, 6, V2, W2, 4
			$+2$	B1, 12, C5, 11, D15, E1, 11, F13, H11, W1
			$+3$	C7
Impeller or agitator circumference	U_s	L/θ	-2	P14
			-1	D9
Light	V_l	L/θ	-1	L8
Sound	V_s	L/θ	-1	M2, N1, S1
Waves	V_w	L/θ	-1	V1
			-1	P3
Velocity gradient	dV/dL	$1/\theta$	-2	R12
Velocity of Alfven waves	V_A	L/θ	-1	A2, K2, M4
			$+1$	A2, N1
			$+2$	C11
Velocity of bearing surface	v_s	L/θ	$+1$	H8, O1, S9

Flow Rates (Mass Fluxes)

Mass flow rate (mass flux)	V_m	M/θ	-1	B2, M11, T7
			$+1$	F6, 7, 8, G4, T7
Mass flux density (mass flux, unit area)	G	$M\ L^2\theta$	-1	J2, 3, P15, S13
			$+1$	K4, M11
Mass flux/unit volume (reaction rate)	U	$M/L^3\theta$	$+\frac{1}{2}$	T3
			$+1$	D1, 2, 3, 4
Reaction rate constant	K	L/θ	-1	S5
Volumetric flow rate	V_f	L^3/θ	-1	H9
			$-\frac{1}{2}$	D11
			$+\frac{1}{2}$	S11, 12
			$+1$	D9, F9

Heat Fluxes

Heat flux (heat flow/unit time)	q	ML^2, θ^3	$+1$	H5
Heat flux/unit area	q^*	M/θ^3	$+1$	K3, R6
Heat liberated/unit mass	Q	L^2/θ^2 (H/M)	$+1$	D3, 4
Rate of heat liberation/unit volume (heat source power)	j	$M/L\theta^3$	$+1$	P5

Transfer Coefficients

Parameter	Symbol	Dimensions	Exponent	Group
Heat transfer coefficient	h	$M/T\theta^3$	$+1$	B2, 4, C9, J2, N6, P15, S13
		$(H/L^2T\theta)$	$+4$	M1
Mass transfer coefficient	k_x	L/θ	$+1$	B5, J3, L9, N7, S5, 7

FORCE, HEAD, POWER, PRESSURE

Forces

Force (resistance)	F, F_R	ML/θ^2	$-\frac{1}{3}$	S2
			$+\frac{1}{3}$	K5
			$+1$	N2, 3, 4, R9
Force/unit length	F_b	M/θ^2	$+1$	H8, O1, S9

Heads, Power

Fluid head	H'	L	$-\frac{3}{4}$	S11
			$+1$	H4
Head (energy per unit mass of fluid $= gH'$)	H	L^2/θ^2	-1	P3, T4
			$-\frac{3}{4}$	S12
			$+\frac{1}{4}$	D11
			$+1$	A6, P14, T4
Power	π	ML^2/θ^3 (LF/θ)	$+1$	L1, P7

Pressures

Pressure	P	$M/L\theta^2$	-1	F6, 7, 8, H9, S8, T8
			$+1$	B13, C6, L6, P13, R2
Pressure drop	$\Delta P, dP$	$M/L\theta$	$+1$	E9, 10, F1, H9, L3, R10
Pressure gradient	$\Delta P/L,$	$M/L^2\theta^2$	$+1$	E10, F1, K1, P4, R10

CONSTANTS AND MISCELLANEOUS QUANTITIES

Gravity Acceleration

Gravity acceleration	.....	L/θ^2	-2	A1
			-1	B1, F13, 15, M1, S6
			$-\frac{3}{4}$	S11
			$-\frac{1}{2}$	B11, F14, P13
			$-\frac{1}{3}$	C9, S3
			$+\frac{1}{3}$	F2, N8
			$+1$	A5, B9, C2, 10, D13, E8, G1, 5, H4, R5, 6, 8, 13

Other Quantities

Avogadro's number	N	$1/M$	$+1$	K9, S6
Boltzmann's constant	k	.....	-1	K9, S6
Dufour coefficient	β	T	$+1$	A3, 4, F3
Energy of activation	E_a	L^2/θ^2	$+1$	A6
Gas constant	$\mathcal{R}$	L^2/θ^2T	-1	A6
			$-\frac{1}{2}$	L5
Shape factor	ξ^*	.....	$+1$	V2
Soret coefficient	δ	$1/T$	$+1$	F3, P6
Stefan constant	η	$M/T^4\theta^3$	-1	R1, T6
			$+1$	S14

TABLE B
ALPHABETICAL LIST OF NAMED GROUPS

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
A1	Acceleration number	$\overline{K}_g$	$E^2/\rho g^2\mu^2 = (N_{Re}N_{Fr1})^2/(H_o)^3$	Group dependent only on physical properties	Accelerated flow	(*25*)
A2	Alfven number	N_{Al}	V_A/V (or V/V_A) [*cf.* Cowling No. Kármán No. (2), magnetic mach number]	Ratio of Alfven wave velocity/fluid velocity	Magneto-fluid dynamics	(*5, 6*)
A3	Anonymous group (1)	ϵ	$\beta^* c/r$ [see also Fedorov No. (2)]		Transfer processes	(*39*)
A4	Anonymous group (2)	K_1	$\beta^*\Delta n/\Delta t$; Δt = temp. diff. [T]; Δn = conc. diff. [$^-$]		Transfer processes	(*67*)
A5	Archimedes number	N_{Ar}	$\frac{gL^3\rho}{\mu^2}(\rho - \rho_o)$; ρ_o = fluid density; ρ = particle density (*cf.* N_{Ga1})	N_{Re}, gravitational force/viscous force	Fluidization, motion of liquids due to density differences	(*6, 13*)
A6	Arrhenius group	.....	$E_a/\Re T$	Activation energy/potential energy of fluid	Reaction rates	(*5*)
B1	Bagnold number	B	$3c\alpha\rho_g V^2/4d\rho_p g$; ρ_g = gas density; ρ_p = particle density	Drag force/gravitational force	Saltation studies	(*12*)
B2	Bansen number	N_{Ba}	$h_r A_w/V_{mc}$; h_r = radiant heat transfer coefficient; A_w = wall area of channel; (*cf.* N_{St})	Heat transferred by radiation/thermal capacity of fluid	Radiation	(*1*)
B3	Bingham number	N_{Bm}	$\tau_y L/\mu_P V$ (L = channel width)	Ratio of yield stress/viscous stress	Flow of Bingham plastics	(*5*)
B4	Biot number (heat transfer	N_{Bi_h}	hL_m/k (in French literature, "Biot No." = N_{Nu})	Midplane thermal internal resistance/surface film resistance	Unsteady state heat transfer	(*5, 6, 13*)
B5	Biot number (mass transfer)	N_{Bi_m}	$k_c L/D_{int}$; L = thickness of layer, D_{int} = diffusivity at interface	Mass transfer rate at interface/mass transfer rate in interior of solid wall thickness L	Mass transfer between fluid and solid	(*13*)
B6	Blake number	B	$V\rho/[\mu(1 - e)S]$	Inertial force/viscous force	Beds of particles	(*6*)
B7	Bodenstein number	N_{Bo}	$VL/D_a = N_{Pe_m}$; L = reactor length, D_a = axial diffusivity (effective) (L^2/θ)		Diffusion in reactors	(*6*)
B8	Boltzmann number	N_{Bo}	≡ Thring radiation group			(*1*)
B9	Bond number	N_{Bo}	$(\rho - \rho')L^2 g/\sigma = N_{We1}/N_{Fr1}$ if $\rho - \rho' \cong \rho$ (gas in liq.); ρ = drop or bubble density; ρ' = medium density	Gravitational force/surface tension force	Atomization, motion of bubbles and drops	(*5*)
B10	Bouguer number	N_{Bu}, B	$3C_D\lambda_r/4\rho_D\overline{R}$; C_D = wt. dust/unit bed volume (M/L^3), λ_r = mean path for radiation (L), ρ_D = dust density, $\overline{R}$ = mean particle radius. Also $N_{Bu} = kL$; L = characteristic dimension, k = absorption coefficient of medium		Radiant heat transfer to dust—gas streams	(*66*)
B11	Boussinesq number	B	$V/(2gR_H)^{1/2}$ (*cf.* N_{Fr2})	(Inertia force/gravitational force)$^{1/2}$	Wave behavior in open channels	(*6*)
B12	Brinkman number	N_{Br}	$\mu V^2/k\Delta t$; Δt = temp. diff.	Heat generation/heat transferred	Viscous flow	(*6*)
B13	Bulygin number	N_{Bu}	$r \cdot \frac{C_b}{C_q} \cdot \frac{P}{t_m - t_o}$ t_m = temp. of medium, t_o = init. temp. of body	Heat for vaporization/heat to bring liquid to boiling point	Heat transfer during evaporation	(*6, 13, 14*)
C1	Capillary number	$\overline{K}_\sigma$	$\mu^2 E/\rho\sigma^2 = (N_{We_1})^2/H_o.(N_{Re})^2$	Depends only on physical properties	Action of surface tension in flowing media	(*25*)
C2	Capillarity-buoyancy number (physical properties group) (film No.)[a]	$\overline{K}_{\sigma g}$, K_F	$g\mu^4/\rho\sigma^3 = \sqrt{K\sigma/Kg} = (N_{We_1})^3/(N_{Fr_1})(N_{Re})^4$	Depends only on physical properties and g	Effects of surface tension and acceleration in flowing media (two-phase flow)	(*21, 25*)
C3	Capillary number	Ca	$\mu V/\sigma = N_{We}/N_{Re}$	Viscous force/surface-tension force	Atomization, two-phase flow	(*6*)
C4	Carnot number	Ca, N_{Ca}	$(T_2 - T_1)/(T_2)$; T_1, T_2 = abs. temp. of two heat sources or sinks	Theoretical efficiency of Carnot cycle operating between T_1 and T_2		(*21*)
C5	Cauchy number	N_c	$\rho V^2/E_b = (N_{Ma})^2$ = Hooke No.	Inertia force/compressibility force	Compressible flow	(*5, 25*)
C6	Cavitation number	σ_c	$[(p - P_v)/\rho]/(V^2/2)p$ = local static pressure (abs.); P_v = vapor pressure	Excess of local static head over vapor pressure head/velocity head	Cavitation	(*5*)

[a] Very similar to Hu and Kintner's pH factor for drops and bubbles [*A.I.Ch.E. J.* **1**, 42 (1955)].

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
C7	Clausius number	Cl, N_{Cl}	$V^3L\rho/k\Delta T$; ΔT = temp. diff.		Heat conduction in forced flows	(*25*)
C8	Colburn number	.....	Same as Schmidt number			(*5*)
C9	Condensation number (1)	N_{Co}	$(h/k)(\mu^2/\rho^2g)^{1/3}$	$N_{Co} = N_{Nu}\left[\frac{\text{(viscous force)}}{\text{(gravity force)}} \times \frac{1}{Re}\right]^{1/3}$	Condensation	(*5*)
C10	Condensation number (2)	N_{Co}	$L^3\rho^2gr/k\mu\Delta t$; r = latent heat of condensation		Condensation on vertical walls	(*5*)
C11	Cowling number	C	$(V_A/V)^2$ = (Alfven number)^2		Magneto-fluid dynamics	(*6*)
C12	Craya-Curtet number	C_t	$V_k/(V_d^2 - V_k^2/2)^{1/2}$; V_k = kinematic mean velocity, V_d = dynamic mean velocity		Radiant heat transfer	(*3, 27*)
C13	Crispation group	N_{Cr}	$\mu\alpha/\sigma^*L$; σ^* = undisturbed surface tension; L = layer thickness		Convection currents	(*55*)
C14	Crocco number	N_{Cr}	$V/V_{max} = \left[1 + \frac{2}{(\gamma - 1)(N_{Ma})^2}\right]^{-1/2}$ V_{max} = maximum velocity of gas expanding adiabatically	Velocity/maximum velocity	Compressible flow	(*5*)
D1	Damköhler group I	DaI	UL/V_{cA}	Chemical reaction rate/bulk mass flow rate	Chemical reaction, momentum, and heat transfer	(*5*)
D2	Damköhler group II	DaII	UL^2/D_{cA}	Chemical reaction rate/molecular diffusion rate	Chemical reaction, momentum, and heat transfer	(*5*)
D3	Damköhler group III	DaIII	$QUL/C_p\rho Vt$	Heat liberated/bulk transport of heat	Chemical reaction, momentum, and heat transfer	(*5*)
D4	Damköhler group IV	DaIV	QUL^2/kt	Heat liberated/conductive heat transfer	Chemical reaction, momentum, and heat transfer	(*5*)
D5	Damköhler group V	DaV	$= (N_{Re})$			(*5*)
D6	Darcy number		$4f$; see Fanning friction factor			(*5*)
D7	Dean number	N_D	$(VL\rho/\mu)(L/2R)^{1/2}$; L = pipe diam.; R = radius of curvature of bend	N_{Re} (centrifugal force/inertial force)	Flow in curved channels	(*5, 6*)
D8	Deborah number	D	θ_r/θ_o; θ_o = observation time	Relaxation time/observation time	Rheology	(*49*)
D9	Delivery number	ϕ	V_f/Aw; A = impeller area = $\pi d^2/4$ = [Diameter No.]$^{-3}$ [Speed No.]$^{-1}$		Flow machines	(*25*)
D10	Deryagin number	De	$L(\rho g/2\sigma)^{1/2}$; L = film thickness	Film thickness/capillary length	Coating	(*58*)
D11	Diameter group	δ	$(\pi/4)^{1/2}(2H)^{1/4}\, d/(V_f)^{1/2}$, d = impeller diam. = [pressure No.]$^{1/4}$ × [delivery No.]$^{-1/2}$		Flow machines	(*25*)
D12	Diffusion group	β	$D\theta/L_m^2$; D = diffusivity of solute through stationary solution contained in solid; *cf.* N_{Fom}		Mass transfer	(*37*)
D13	Drag coefficient	$C_d = C_D$	$(\rho - \rho')L_0/\rho V^2$; ρ = density of object; ρ' = density of medium; *cf.* f, ψ, N_e	Gravity force/inertial force	Free settling velocities, etc.	(*5*)
D14	Drew number	N_D	$\frac{Z_A(M_A - M_B) + M_B}{(Z_A - Y_{AW})(M_B - M_A)} \ln\frac{M_V}{M_W}$: M_A, M_B = mol. wt. of components A and B; M_V, M_W = mol. wt. of mixture in vapor and at wall; Y_{AW} = mole fraction of A at wall; Z_A = mole fraction of A in diffusing stream		Boundary layer mass transfer rates; velocity profile distortion; drag coefficients for binary system	(*22*)
D15	Dulong number	Du, N_{Du}	$V^2/C_p\Delta T$ = Eckert No.			(*25*)
E1	Eckert number	N_E	$V_\infty^2/C_p\Delta T$, V_∞ = velocity of fluid far from body (= 2/recovery factor, *q.v.* = Dulong No.)		Compressible flow	(*5, 24*)
E2	Ekman number		$(\mu/2\rho\omega L^2)^{1/2} = (N_{Ro}/N_{Re})^{1/2}$	(Viscous force/Coriolis force)$^{1/2}$	Magneto-fluid dynamics	(*6*)

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
E3	Elasticity number (1)	N_{El_1}	$\theta_r\mu/\rho L^2$, L = pipe radius	Elastic force/inertial force	Viscoelastic flow	(*5*)
E4	Elasticity number (2)	$\bar{K}_E$	$\rho C_p/\beta E \equiv$ [Gay Lussac No.] × [Hooke No.] ÷ [Dulong No.]	Depends on physical properties only	Effect of elasticity in flow processes	(*25*)
E5	Ellis number	N_{El}	$\mu_o V/2\tau_{1/2}R$; μ_o = zero shear viscosity, $\tau_{1/2}$ = shear stress when $\mu = \mu_o/2[M/L\theta^2]$; R = tube radius		Flow of non-Newtonian liquids	(*38*)
E6	Elsasser number	N_{El}	$\rho/\mu\sigma_e\mu_e \equiv N_{Re}/$[magnetic Reynolds No.]		Magneto-fluid dynamics	(*6*)
E7	Entry Reynolds Number	K_E	$\chi/d_h \,.\, N_{Re} = \dfrac{\chi V\rho}{\mu}$; χ = entry length	As N_{Re}	Entry or inlet processes	(*25*)
E8	Eötvös number	N_{Eo}	$(\rho - \rho')L^2g/\sigma \equiv$ Bond No., *q.v.*			(*6*)
E9	Euler number (1)	N_{Eu_1}	$\Delta P_F/\rho V^2$; ΔP_F = pressure drop due to friction	Friction head/2 × velocity head	Fluid friction in conduits	(*5, 13, 25*)
E10	Euler number (2)	N_{Eu_2}	$d(-dp/dL)\rho V^2$; d = pipe diam., dp/dL = pressure gradient ≡ 2 × Fanning friction factor		Fluid friction in conduits	
E11	Evaporation number	K_r	V^2/r [r = heat of vaporization (L^2/θ^2)]		Evaporation processes	(*25*)
E12	Evaporation number (2)	$\bar{K}_r$	$C_p/r\beta$ (r as in **E11**) ≡ (Gay Lussac No.) × (**E11**)/(Dulong No.)		Evaporation processes	(*25*)
E13	Evaporation-elasticity number	$\bar{K}_{rE}$	$E/r\rho$ = K_t/Hooke number		Evaporation processes	(*25*)
F1	Fanning friction factor	f	$d\Delta p_F/2\rho V^2L$, d = dimension of cross section; L = length (*cf.* resistance coeff., Ne)	Shear stress at wall expressed as number of velocity heads	Fluid friction in conduits	(*5*)
F2	Fedorov number (1)	F_{e_1}, N_{Fe_1}	$d_e\sqrt[3]{\dfrac{4g\rho^2}{3\mu^2}\left(\dfrac{\gamma M - 1}{\gamma g}\right)}$; d_e = equiv. particle diam.; γM = sp. gr. of particles; γg = sp. gr. of gas (*cf.* N_{Ar})		Fluidized beds	(*6, 13*)
F3	Fedorov number (2)	F_{e_2} N_{Fe_2}	$\delta\beta^* = K_1Pn = \epsilon \times K_oPn$	Mass transfer analogy of Posnov number	Transport processes	(*39, 67*)
F4	Fenske number	N_F		Number of stages in separation process		(*6*)
F5	Fineness coefficient	ψ	$L/W_D^{1/3}$; W_D = volume displacement $[L^3]$		Ship modeling	(*26*), (*43*)
F6 **F7**	Fliegner numbers	$F(M_a)$ $f(M_a)$	Functions of ratio of specific heats and mach number			
F8		$I(M_a)$	$V_m(cT)^{1/2}/A(p_s + \rho V^2) = \gamma/(\gamma - 1)^{1/2}\, Ma/1 + \gamma Ma^2 \times [1 + (\gamma - 1)/2\ Ma^2]^{1/2}$ = impulse Fliegner number; γ = ratio of specific heats, Ma = mach number, A = flow area			(*43*)
F9	Flow coefficient	C_Q	V_f/Nd, d = impeller diam.		Power required by fans, etc.	(*32*)
F10	Fluidization number		V/V_{init}, V_{init} = velocity for initial fluidization	Fluid velocity in fluidized bed/that at start of fluidization	Fluidization	(*59*)
F11	Fourier number (heat transfer)	N_{Foh}	$k\theta/\rho c_p L_m$		Unsteady state heat transfer	(*5, 13, 14, 25*)
F12	Fourier number (mass transfer)	N_{Fom}	$D\theta/L^2 = k_c\theta/L$ (*cf.* **D9**)		Unsteady state mass transfer	(*13*)
F13	Froude number (1)	N_{Fr_1}	$V^2/gL \equiv (N_{Fr_2})^2$ (*cf.* Reech No., Boussinesq No., Vedernikov No.)	Inertial force/gravitational force	Wave and surface behavior	(*5, 13, 25*)
F14	Froude number (2)	N_{Fr_2}	$V/\sqrt{gL} \equiv (N_{Fr_1})^{1/2}$ (*cf.* Boussinesq No.)	Velocity of open channel flow/speed of very small gravity wave	Open channel flow; free surfaces	(*7, 50*)
F15	Froude numbers (rotating)	Fr	DN^2/g; D = impeller diam.		Agitation	(*64*)
G1	Galileo number	N_{Ga_1}	$L^3g\rho^2/\mu^2$ (*cf.* N_{Ar}, Nusselt thickness group)	$N_{Ga_1} = N_{Re} \times$ gravity force/viscous force	Circulation of viscous liquid, thermal expansion	(*5, 13*)
G2	Gay Lussac number	Ga, N_{Ga_2}	$1/\beta\Delta T$		Thermal expansion processes	(*25*)
G3	Goucher number	N_{Go}	$R(\rho g/2\sigma)^{1/2}$; R = wall or wire radius	Gravitational force/surface tension force$^{1/2}$	Coating	(*24*)

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
G4	Graetz (Grätz) number	N_{Gz}	$V_m c_p/kL$	Thermal capacity fluid/convective heat transfer	Streamline flow	(*5*, *25*)
G5	Grashof number	N_{Gr}	$L^3\rho^2 g\beta\Delta t/\mu^2 \equiv N_{Ga_1}/N_{Ga_2} \equiv (N_{Re})^2/(N_{Ga_2})(N_{Fr_1})$	$N_{Gr} = N_{Re}$ (buoyancy force/viscous force)	Free convection	(*5*, *13*, *25*)
G6	Gukhman number	Gu, N_{Gu}	$(t_o - t_m)/T_o$; t_o, T_o = temp. (°C., °K.) of hot gas stream, t_m = temp. of moist surface (wet bulb temp.)	Thermodynamic criterion of evaporation under isobaric adiabatic conditions	Convective heat transfer in evaporation	(*6*, *23*, *17*, *53*)
G7	Guldberg-Waage group	N_{Gw}	Given by equation relating volumes of reacting gases and reaction products		Chemical reaction in blast furnaces	(*5*)
H1	Hall coefficient	N_H	$f_c J$ (f_c = cyclotron frequency, J = av. free path/av. veloc.)		Magneto-fluid dynamics	(*7*)
H2	Hartmann number	M_H	$(\mu_e^2 H_e^2 \sigma_e L^2/\mu)^{1/2} \equiv (SR_M N_{Re})^{1/2} \equiv (N_{Re} N)^{1/2}$	Magnetically induced stress/hydrodynamic shear stress (magnetic body force/viscous force)$^{1/2}$	Magneto-fluid dynamics	(*5*, *6*)
H3	Hatta number	β	$\gamma/\tanh\gamma$; $\gamma = (rCD)^{1/2}/k_c$, r = reaction rate constant $[L^3/M\theta]$ [a modified Hatta number has also been defined (*35*)]		Gas absorption with chemical reaction	(*41*)
H4	Head coefficient	C_H	gH'/Nd^2 (d = impeller diam.)		Flow in pumps and fans	(*32*)
H5	Heat transfer number	K_Q	$q/V^3L^2\rho$		Heat transfer in stream	(*25*)
H6	Hedstrom number	N_{He}	$\tau_y L^2\rho/\mu_p^2 \equiv (N_{Re}) \times (N_{Bm})$		Flow of Bingham plastics	(*5*)
H7	Helmholtz resonator group		$(d^3/W)^{1/2}/M\alpha$	Proportional to frequency × residence time	Pulsating combustion	(*28*)
H8	Hersey numbers		$F_b/\mu v_s$ (*cf.* truncation number)	Load force/viscous force	Lubrication	(*6*)
H9	Hodgson number	N_H	$wf\Delta\rho F/\bar{V}_f \cdot \bar{p}_s$	Time constant of system/period of pulsation	Pulsating gas flow	(*5*)
H10	Homochronous number	H_{o_1}	$V\theta/L$ (θ = time for liquid to move characteristic distance L)	Duration of process/time for liquid to move through L	Choice of time scales	(*13*)
H11	Hooke number	H_{o_2}	$\rho V^2/E$ = Cauchy No., *q.v.*		Elasticity of flowing media	(*25*)
J1	Jakob modulus	Ja	$C_P\rho_L\Delta t/r\rho_v$ (ρ_L, ρ_v = densities of liquid and vapor; Δt = liquid superheat temperature diff.)	Maximum bubble radius/thickness of superheated film	Boiling	(*6*)
J2	J-factor (heat transfer)	j_H	$(h/c_pG)(c_p\mu/k)^{2/3} \equiv (N_{Nu})/(N_{Re})(N_{Pr})^{1/3}$		Heat, mass and momentum transfer theory	(*5*)
J3	J-factor (mass transfer)	j_M	$(k_c\rho/G)(\mu/\rho D)^{2/3} \equiv (k_c\rho/G)(N_{Sc})^{2/3}$			(*5*)
J4	Joule number	J	$2\rho C_p\Delta t/\mu_e H_e^2 \equiv 2(N_{Re})(R_M)/(M_H)^2(N_E)$	Joule heating energy/magnetic field energy	Magneto-fluid dynamics	(*6*)
K1	Kármán number (1)	N_K	$\rho d^3(-dp/dL)/\mu^2$ (d = pipe diam., dp/dL = pressure gradient) $\equiv 2(N_{Re}\sqrt{f})^2$		Fluid friction in conduits	(*5*)
K2	Kármán number (2)	K	V/V_A (see Alfven No.)		Magneto-fluid dynamics	(*6*)
K3	Kirpichev number for heat transfer	Ki_q, N_{Ki_q}	$q^*L/k\Delta t$ (*cf.* N_{Bi}, N_{Nu})	Intensity external heat transfer/internal heat transfer intensity	Heat transfer	(*6*, *14*)
K4	Kirpichev number for mass transfer	Ki_m	$GL/D\rho n^*$ (*cf.* N_{Pe_m}, N_{Bim})	Intensity external mass transfer/internal mass transfer intensity	Mass transfer	(*13*, *14*)
K5	Kirpitcheff number		$(\rho F_K/\mu^2)^{1/3} = 3\sqrt{(N_{Re})^2 cf}$		Flow around obstacles	(*34*)
K6	Knudsen number (1)	N_{Kn}	λ/L	Length of mean free path/characteristic dimension	Low pressure gas flow	(*5*)
K7	Knudsen number (2)	N_{Kn_A}	$\rho D/_{AB}D_{KA}\zeta$	Bulk diffusion/Knudsen diffusion	Gaseous diffusion in packed beds	(*6*)
K8	Kossovich number	K_o, N_{Ko}	$r_v\Delta n_m/c\Delta t$	Heat used for evaporation/heat used in raising temperature of body	Convective heat transfer during evaporation	(*6*, *14*)

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
K9	Kronig number	Kr	$4L^2\beta\rho^2\Delta t E_S^2 N[\alpha + 2/3(p_o^2/k\Gamma)]/u^2M$ E_S = electric field at surface, N = Avogadro's Number, α = polarization coefficient, p_o = molecular dipole moment, k = Boltzmann's constant, M = molecular weight	(N_{Re})(electrostatic force/viscous force	Convective heat transfer	(*6, 44*)
K10	Kutateladze number (1)	Ku	$IEL/\rho Vu'$; I = current density $[Q/L^2\theta]$, E = voltage $[ML/Q\theta^2]$, u' = enthalpy $[L^2/\theta^2]$		Electric arcs in gas streams	(*65*)
K11	Kutateladze number (2)	K	$r_v/c_p(t_o - t_w)$, (t_o, t_w = stream, wall temp.)		Combined heat and mass transfer in evaporation	(*65*)
L1	Lagrange group (1)	La_1	$\pi/\mu L^3N^2$; L = characteristic dimension of agitator = $N_{Re}.N_p$		Agitation	(*6*)
L2	Lagrange number (2)	La_2	$(D + E_D)/D$	Combined molecular and eddy mass transfer rate/molecular mass transfer rate	Mass transfer in turbulent systems	(*31*)
L3	Lagrange number (3)	La_3	$\Delta P\ R/\mu V$		Magneto-fluid dynamics	(*6*)
L4	Larmor number	R_{La}	L_L/L; (L_L = Larmor radius)		Magneto-fluid dynamics	(*23*)
L5	Laval number	La	$V/[^2\gamma/(\gamma + 1)RT]^{1/2}$; γ = ratio of specific heats	Linear velocity/critical velocity of sound	Compressible flow	(*56*)
L6	Leverett function	J	$(\xi/e)^{1/2}(P_\sigma/\sigma)$	Characteristic dimension of surface curvature/characteristic dimension of pores	Two-phase flow in porous media	(*6*)
L7	Lewis	N_{Le}	$k/\rho c_p D = \alpha/D \equiv N_{Sc}/N_{Pr}$ (N.B.: Lewis number is sometimes defined as reciprocal of this quantity)		Combined heat and mass transfer	(*5, 25*)
L8	Lorentz number	N_{Lo}	V/V_1; (V_1 = velocity of light)	Fluid velocity/velocity of light	Magneto-fluid dynamics	(*6*)
L9	Luikov (Lȳkov) number	Lu	$k_cL/\alpha = k_cL\rho C_p/k$	Mass diffusivity/thermal diffusivity; rate of extension of mass transfer field/rate of extension of heat transfer field	Combined heat and transfer	(*6, 13*)
L10	Lukomskii number	Lu	α/a_m; a_m = potential conductivity of mass transfer $[L^2/\theta]$		Combined heat and mass transfer	(*36*)
L11	Lundquist number	N_{Lu}	$\sigma_e H_e\mu_e^{3/2}L/\rho^{1/2} = M_H(R_M/N_{Re})^{1/2}$ (L = thickness of fluid layer)		Magneto-fluid dynamics	(*6*)
L12	Lyashchenko number	Ly	$\equiv N^3_{Re}/N_{Ar}$		Fluidization	(*19*)
L13	Lykoudis number	N_{Ly}	$(\mu_e H_e)^2 \frac{\sigma_e}{\rho}\left[\frac{L}{g\beta\Delta t}\right]^{1/2} \equiv (M_H)^2/(NGr)^{1/2}$		Magneto-fluid dynamics	(*6*)
M1	McAdams group		$h^4L\mu\Delta t/k^3\rho^2g\gamma$	Constant for given surface orientation	Condensation	(*5*)
M2	Mach number	N_{Ma}, Ma	V/V_s; (V_s = velocity of sound in fluid) $\equiv v/\sqrt{E_b/\rho}$; (E_b = bulk modulus of fluid) (*cf.* Sarrau number)	Linear velocity/sonic velocity	Compressible flow	(*5–7, 25, 50*)
M3	Magnetic force parameter	N	$\mu_e^2H_e^2\sigma_eL/\rho V$	Magnetic body force/inertia force; resistance time of fluid in field/relaxation time of lines of force	Magneto-fluid dynamics	(*6*)
M4	Magnetic mach number	M_{Ma}	V/V_a (see Alfven number)		Magneto-fluid dynamics	(*6*)
M5	Magnetic Oseen number	k	$\frac{1}{2}(1 - N_{Al}^2)R_M$	Magnetic force/inertia force	Magneto-fluid dynamics	(*2*)
M6	Magnetic pressure number	S	$\mu_eH_e^2/\rho V^2$	Magnetic pressure/2 × dynamic pressure	Magneto-fluid dynamics	(*5*)
M7	Magnetic Reynolds number	R_M	$\sigma_c\mu_eLV$ (*cf.* velocity number)	Mass transport diffusivity/magnetic diffusivity	Magneto-fluid dynamics	(*5*)
M8	Maievskii number		$\equiv Ma$		Compressible flow	(*12*)
M9	Marangoni number	N_{Ma}	$\frac{\Delta\sigma}{\Delta t}\frac{\Delta t}{\Delta L}L^2/\mu\alpha$; L = layer thickness		Cellular convection	(*46*)

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
M10	Margoulis number	M	$\equiv N_{Sl}$		Forced convection	(6, 7)
M11	Merkel number	N_{Me}	$GA^*W^*/(V_m)$ gas	Mass of water transferred in cooling per unit humidity difference/mass of dry gas	Cooling towers, liquid-gas contact	(5)
M12	Miniovich number	Mn	SR/e; R = pore radius		Drying	(36)
M13	Mondt number	N_{Mo}		Convective/conductive heat transfer	Heat transfer	(6)
N1	Naze number	N_a	$V_A/V_s \equiv (N_{Ma}.N_{A1})$	Velocity Alfven wave/velocity of sound	Magneto-fluid dynamics	(6)
N2	Newton inertial force group	N_I	$F/\rho V^2L^2$	Imposed force/inertial force	Agitation	(5)
N3	Newton number	N_s	$F_R/\rho V^2L^2$; (*cf.* f, ψ)	Resistance force/inertia force	Friction in fluid flow	(25)
N4	Number of velocity heads	N	$(F/\rho L^2)/(V^2/2)$	Imposed head/velocity head	Friction in conduits	(6)
N5	Number for similarity of phys. and chem. changes	K	$\gamma/C_p\Delta t$	Heat flow for phase change/superheat (supercooling) of one of the phases	Changes of phase	(14)
N6	Nusselt number	N_{Nu}	$hL/k \equiv (N_{Re}N_{St})$ (*cf.* N_{Bi_h}, Ki_q)	Total heat transfer/conductive heat transfer	Forced convection	(5, 13, 25)
N7	Nusselt number for mass transfer	N_{Um}, N_{Nu_m}	$k_cL/D = N_{Sh}$	Intensity of mass flux at interface/specific flux by pure molecular diffusion in layer of thickness, L	Mass transfer	(13, 20)
N8	Nusselt film thickness group	ψ, N_T	$L_f(\rho^2g/\mu^2)^{1/3} \equiv (N_{Ga})^{1/3}$; ($L_f$ = film thickness)	= $(N_{Re})^{1/3}$ (gravitational force/viscous force)$^{1/3}$	Falling films	(6)
O1	Ocvirk number		$(F_b/\mu V_s)(a/R)^2(D/b)^2$; ($v_s$ = shaft surface velocity; R = shaft radius; D = shaft diam.) (*cf.* Ns)	Load force/viscous force	Lubrication	(6)
O2	Ohnesorge number	Z	$\mu/(\rho L\sigma)^{1/2} = (N_{We_1})^{1/2}/(N_{Re})$	Viscous force/(inertia force × surface tension force)$^{1/2}$	Atomization	(5)
P1	Péclet number (heat)	Pe, N_{Pe_h}	$LV\rho C_p/k = LV/\alpha = (N_{Re}.N_{Pr})$	Bulk heat transfer/conductive heat transfer	Forced convection	(5, 13, 25)
P2	Péclet number (mass)	N_{Pe_m}	$LV/D = (N_{Re}.N_{Sc})$	Bulk mass transfer/ diffusive mass transfer	Mass transfer	(5)
P3	Pipeline parameter	ρn	$V_WV_o/2\ H_s'$; (V_W = velocity water-hammer wave, V_o = initial velocity, H_s' = static head × $g[L^2/\theta^2]$	Maximum pressure rise in water hammer/2 × static pressure	Water hammer	(5)
P4	Poiseuille number		$D^2(-dp/dL)/\mu V$ (D = pipe diam., dp/dL = pressure gradient)	= 32 for laminar flow in round pipe	Laminar fluid friction	(5)
P5	Pomerantsev number	P_o	$jL^2/k(t_m - t_o)$ (t_m, t_o = temp. of medium, initial temp. of body) (*cf.* Damköhler Group IV)		Heat transfer with heat sources in medium	(6, 14, 60)
P6	Posnov number	Pn	$\delta\Delta t/(\Delta n_m)$ (*cf.* Fe_2)		Combined heat and mass transfer	(13, 14, 67)
P7	Power number	N_P	$\pi/L^5\rho N^3$	Drag on (agitator impeller) or inertial force	Power consumption by agitators, fans, pumps, etc.	(5, 32)
P8	Prandtl number	N_{Pr}	$C_p\mu/k$ = Da IV/Da III × Da V	Momentum diffusivity/thermal diffusivity	Forced and free convection	(5, 13, 25)
P9	Prandtl number (mass transfer)	Pr_m	$\mu/\rho D = N_{Sc}$, v (used in Russian, German literature)	See Schmidt number		(13)
P10	Prandtl velocity ratio	u^+	$V/(\tau_W/\rho)^{1/2}$ (V = local fluid velocity)	Inertial force/wall shear force$^{1/2}$	Turbulence studies	(5)
P11	Prandtl dimensionless distance	y^+	$L(\rho\tau_W)^{1/2}/\mu$ (L = distance from wall, etc.)		Turbulence studies	
P12	Predvoditelev number	Pd	$\Gamma L^2/\alpha t_o = \left(\frac{dt^*}{\alpha(N_{Fo})}\right)_{max}$ where t_o = init. temp. of body, t^* = temp. of medium relative to its initial temp.	Rate of change of temp. of medium/rate of change of temp. of body	Heat transfer	(13, 14, 60)

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
P13	Pressure number (1)	K_P	$P/\{g\sigma(\rho' - \rho'')\}^{1/2}$ (ρ', ρ'' = density of liquid gas)	Absolute pressure in system (pressure jump on interface)		(*14*)
P14	Pressure number (2)		$H/\frac{1}{2}U_s^2$ (U_s = circumferential velocity) ≡ [diameter No.]$^{-2}$ × [Speed No.]$^{-2}$		Flow machines (turbines, pumps, etc.)	(*25*)
P15	Psychrometric ratio		h_c/Gs	Heat transfer by convection/heat transfer by mass transfer	Wet and dry bulb thermometry	(*5*)
R1	Radiation number	$\bar{K}_s$	$kE/\eta\sigma T^3 = (N_{We_1})/$(Hooke No.) × (Stefan No.)		Radiant transfer	(*25*)
R2	Ramzin number	Ra	$\frac{C_bP}{C_m(\Delta\Omega)} = \frac{\text{(Bulygin No.)}}{\text{(Kosovich No.)}}$		Molar mass transfer	(*40*)
R3	Ratio of specific heats	γ	C_p/C_v (specific heats at constant pressure, volume)		Compressible flow	(*5*)
R4	Rayleigh number (1)	N_{Ra_1}	$V(\rho L/\sigma)^{1/2} = N_{We_2}$ (*q.v.*)	See N_{We}	Breakup of liquid jets	(*5*)
R5	Rayleigh number (2)	R_2'	$L^3\rho^2g\beta c_p\Delta t/\mu k = L^3\rho g\beta\Delta t/\mu\alpha = (N_{Gr}) \cdot (N_{Pr})$		Free convection	(*5, 25*)
R6	Rayleigh number (3)	Ra_3	$q^*L^5\rho^2g\beta C_p/\mu k^2x = (N_{Gr})(N_{Pr})(N_{Nu})(L/x)$; ($L$ = pipe diam.)		Combined free and forced convection in vertical tubes	(*6*)
R7	Recovery factor	N_{rf}	$C_p(t_{aw} - t_m)/V^2$; t_{aw} = attained adiabatic wall temp. t_m = temp. of moving medium. (*cf.* Eckert No.)	Actual temp. recovery/theoretical temp. recovery	Convective heat transfer in compressible flow	(*5*)
R8	Reech number		$= 1/(N_{Fr_1})$ *q.v.*		Wave and surface behavior	(*6*)
R9	Resistance coefficient (1)	C_f	$F_R/\frac{1}{2}\rho V^2L^2$ (*cf.* drag coeff., Newton number, Fanning factor)		Flow resistance	(*25*)
R10	Resistance coefficient (2)	ψ	$\Delta p \cdot D_H/\frac{1}{2}\rho V^2L$ (Δp = pressure drop over length, L) (*cf.* **R9**)		Fluid friction in conduits	(*25*)
R11	Reynolds number	N_{Re}	$LV\rho/\mu$	Inertia force/viscous force	Dynamic similarity	(*5, 25*)
R12	Reynolds number (rotating)	Re	$L^2N\rho/\mu$; L = impeller diam.		Agitation	(*45*)
R13	Richardson number	N_{Ri}	$-(g/\rho)(d\rho/dL)/(dV/dL)w^2$ [L = height of liquid layer, $(dV/dL)_w$ = velocity gradient at wall]	Gravity force/inertial force	Stratified flow of multilayer systems	(*54*)
R14	Romankov number	R_o'	T_D/T_{PROD}	Dry bulb temperature (abs.)/product temperature (abs.)	Drying	(*6, 52*)
R15	Rossby number	N_{Ro}	$V/2\omega_eL \sin\Lambda$ (ω_e = angular velocity of earth's rotation [$1/\theta$]; Λ = angle between axis of earth's rotation and direction of fluid motion [–])	Inertia force/Coriolis force	Effect of earth's rotation on flow in pipes	(*5*)
R16	Roughness factor		ϵ/L		Fluid friction	(*5*)
S1	Sarrau number		≡ mach number, *q.v.*		Compressible flow	(*6*)
S2	Schiller number (1)		$LV(\rho^2/\mu F_R)^{1/3}$		Flow around obstacles	(*34*)
S3	Schiller number (2)	Sch	$V\left[\frac{3}{4} \cdot \frac{\rho\gamma_m}{g\mu(\gamma_M - \gamma_m)}\right]^{1/3}$; V = velocity in fluidized bed; γ_m, γ_M = specific gravity of medium and material in bed		Fluidization	(*66*)
S4	Schmidt number	N_{Sc}	$\mu/\rho D$ (*cf.* N_{Pr_m})(= DaII/DaI DaV)	Kinetic viscosity/molecular diffusivity	Diffusion in flowing	(*5, 25*)
S5	Semenov number	Sm	k_cL/K; K = reaction rate constant [$1/\theta$]		Reaction kinetics	(*11*)
S6	Senftleben number	S_e	$NE_s^2[\alpha + 2/3(\rho_c^2/kT)] \cdot [1/4LM_g]$ Kronig number, *q.v.*		Convective heat transfer	(*6*)
S7	Sherwood number	N_{Sh}	$k_cL/D = Nu_m$ (also termed Taylor number)	Mass diffusivity/molecular diffusivity	Mass transfer	(*5*)
S8	Sommerfeld number (1)	Ns_1	$(\mu N/P_b)(D/a)^2$ (D = shaft diam., (*cf.*) Ocvirk number)	Viscous force/load force	Lubrication	(*5*)
S9	Sommerfeld number (2)	Ns_2	$(F_b/\mu V_s)(a/R)^2$ (V_s = veloc. of shaft surface; R = shaft radius) ($N_{S_2} = 4/\pi N_{S_1}$)	Viscous force/load force	Lubrication	(*6*)

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
S10	Spalding function	Sp	$-\left(\frac{\partial\theta}{\partial u^+}\right)_{u^+=0}$; $\theta = (T - T_\infty) \times (T_w - T_\infty)$, T_w = wall temperature, T_∞ = free stream temp., u^+ = Prandtl velocity ratio	Dimensionless temp. gradient at wall	Convection	(*18, 33*)
S11	Specific speed	C_s	$N(V_f)^{1/2}/(gH')^{3/4}$ (H' = head of liquid produced by one stage) (*cf.* speed number)		Pumps and compressors	(*8, 32*)
S12	Speed number	σ	$(4\eta)^{1/2}(V_f)^{1/2}\ N/(2H)^{3/4}$ = (delivery number)$^{1/2}$ × pressure number)$^{-3/4}$ (*cf.* specific speed)		Flow machines	(*25*)
S13	Stanton number	Ns_t	$h/C_p\rho V = h/C_pG = (N_{Nu})/(N_{Re})(N_{Pr})$	Heat transferred/thermal capacity of fluid	Forced convection	(*5, 6, 13, 25*)
S14	Stefan number	$\overline{St}$	$\eta LT^3/k$		Heat radiation	(*25*)
S15	Stokes number	St	$\mu\theta_v/\rho L^2$ (θ_v = vibration time) = $(N_{St})^{-1}(N_{Re})^{-1}$		Particle dynamics	(*6*)
S16	Strouhal number	Ns_1, Sr	fL/V (*cf.* N_{Th})		Vortex streets; unsteady-state flow	(*6, 25*)
S17	Suratman number	Su	$\rho L\sigma/\mu^2 = (N_{Re})^2/(N_{We_1}) = (Z)^{-2}$		Particle dynamics	(*6*)
S18	Surface elasticity number	N_{El}	$-\frac{\Gamma'}{Ds}L\frac{(\partial\sigma)}{(\partial\Gamma)}$; Γ' = surface concentration of surfactant in undisturbed state, Ds = surface diffusivity, L = film thickness		Convection cells	(*10*)
S19	Surface viscosity number	N_{Vi}	$\mu s/\mu L$; μs = surface viscosity, $[M/\theta]$, L = film thickness		Convection cells	(*10*)
T1	Taylor number (1)	N_{Ta_1}	$\omega_c(R_a)^{1/2}a^{3/2}\rho/\mu$; ($\omega_c$ = angular velocity of cylinder; R_a = mean radius of annulus)		Stability of flow pattern in annulus with rotating cylinder	(*5*)
T2	Taylor number (2)	N_{Ta_2}	$(2\ \omega L^2\rho/\mu)^2$[$\omega$ = rate of spin $(1/\theta)$; L = height of fluid layer]	α(Coriolis force/viscous force)^2	Effect of rotation on free convection	(*6*)
T3	Thiele modulus	m_T	$Q^{1/2}U^{1/2}L/k^{1/2}l^{1/2} = (\mathrm{DaII})^{1/2}$		Diffusion in porous catalysts	(*5*)
T4	Thoma number	σ_T	$(H_a - H_s - H_v)/H$ (H = total head; H_a = atm. pressure head; H_s = suction head; H_v = vapor pressure head)	Net positive suction head/total head	Cavitation in pumps	(*5*)
T5	Thomson number	N_{Th}	$\theta V/L$; θ = characteristic time (*cf.* Ns_1)		Fluid flow	(*6*)
T6	Thring radiation group		$\rho C_pV/e^*\eta T^3$ (*cf.* Boltzmann number)	Bulk heat transport/heat transport by radiation	Radiation	(*5*)
T7	Thring-Newby criterion	θ	$[(V_{m_1} + V_{m_0})/V_{m_0}](R/L)$; V_{m_0}, V_{u_1} = mass flow rates of nozzle fluid and surrounding fluid $[M/\theta]$; R = equivalent nozzle radius; L = furnace half width		Combustion of fuels	(*4*)
T8	Truncation number	r	$\mu\dot{\gamma}/P$ (*cf.* Hersey number)	Shear stress/normal stress	Viscous flow	(*6*)
V1	Valensi number	V	$\omega L^2\rho/\mu$; ω = circular oscillation frequency when $\mu = 0$ $[1/\theta]$		Oscillations of drops and bubbles	(*57*)
V2	Vedernikov number	V	$\zeta^*\xi^*\bar{V}/(V_w - \bar{V}) \equiv \zeta^*\xi^*(N_{Fr_2})$($\zeta^*$ = exponent of hydraulic radius in formula [$^-$]; ζ^* = shape factor of channel section; V_w = absolute velocity of disturbance wave)	Generalized Froude number	Instability of open-channel flow	(*6, 61*)
V3	Velocity number	R_v	≡ Magnetic Reynolds number, *q.v.*			(*5, 6*)
W1	Weber number (1)	N_{We_1}	$V^2\rho L/\sigma = (N_{We_2})^2$	Inertia force/surface tension force	Bubble formation, etc.	(*2, 25*)
W2	Weber number (2)	N_{We_2}	$V(\rho L/\sigma)^{1/2} = (N_{We_1})^{1/2}$			
W3	Weber number (rotating)	W_e	$L^3N^2\rho/\sigma$; L = impeller diameter		Agitation	(*64*)
W4	Weissenberg number	N_{We}	ω_3V/ω_1L; $\omega_3 \doteq \int_0^\infty sG(s)ds, \omega_1 = \int_0^\infty G(s)ds$, G = relaxation modulus of linear viscoelasticity, s = recoverable elastic strain	Viscoelastic force/viscous force	Viscoelastic flow	(*63*)

NUMERICAL DATA PROJECTS

SOURCES OF CRITICAL DATA

The following is abstracted from *Continuing Numerical Data Projects, A Survey and Analysis.* This publication was prepared under the auspices of the Office of Critical Tables, National Academy of Sciences and National Research Council. Persons requesting further information and details regarding the projects listed may obtain the publication from Printing and Publishing Office, National Academy of Sciences, 2101 Constitution Avenue, Washington, D. C., 20418. Price $5.00.

THERMODYNAMIC PROJECTS

Selected Values of Chemical Thermodynamic Properties, NBS Circular 500, F. D. Rossini, D. D. Wagman, W. H. Evans, S. Levine, and I. Jaffe, Government Printing Office, Washington, D.C. 20402, 1952, iv + 1268 pp, $7.25 (out of print). Paperback reprint issued in two parts: I. Tables; and II. References; Government Printing Office, Washington, D.C. 20402, 1961 (out of print). Revisions of C500 are being issued provisionally as NBS Technical Notes, listed below.

Selected Values of Chemical Thermodynamic Properties

Part 1: Tables for the First Twenty-three Elements in the Standard Order of Arrangement, NBS Technical Note 270-1, D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey, and R. H. Schumm, U.S. Government Printing Office, Washington, D.C. 20402, October 1965, iv + 124 pp, $0.65.

Part 2: Tables for the Elements Twenty-four through Thirty-two in the Standard Order of Arrangement, NBS Technical Note 270–2, D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey, and R. H. Schumm, U.S. Government Printing Office, Washington, D.C. 20402, May 1966, iv + 62 pp, $0.40.

Selected Values of Properties of Hydrocarbons and Related Compounds, American Petroleum Institute Research Project 44, J. B. Zwolinski, dir., Texas A&M Research Foundation, College Station, Texas. As of June 1966 there were 2391 valid data sheets, complete set 6 volumes at $0.30 per sheet.

Selected Values of Properties of Chemical Compounds, Thermodynamics Research Center, B. J. Zwolinski, dir., Texas A&M Research Foundation, College Station, Texas. As of June 1966 there were 754 valid data sheets, complete set 2 volumes at $0.30 per sheet.

JANAF (Joint Army-Navy-Air Force) Thermochemical Tables, PB 168 370, D. R. Stull, dir., Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg., 1965, 945 pp, $10.00.

First Addendum, PB 168 370–1, D. R. Stull, dir., Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg., 1966, vii + 197 pp, $4.00 (Supplements 18, 19, 20, and 21).

Information on further supplements is available from Dr. D. R. Stull, dir., Thermal Research Laboratory, Dow Chemical Company, Midland, Michigan.

Contributions to the Data on Theoretical Metallurgy, I–XV, published as Bureau of Mines bulletins between 1932 and 1962. Many bulletins were superceded; six are revisions and Bulletin 601 is a reprinting of four previous bulletins and out of print for some years, but still in demand as essential in present-day research. The ones currently available are listed below.

Contributions to the Data on Theoretical Metallurgy

XIII High-Temperature Heat-Content, Heat Capacity, and Entropy Data for the Elements and Inorganic Compounds, K. K. Kelley, Bulletin 584 (Bureau of Mines), U.S. Government Printing Office, Washington, D.C. 20402, 1960, 232 pp, $1.25.

XIV Entropies of Elements and Inorganic Compounds, K. K. Kelley and E. G. King, Bulletin 592 (Bureau of Mines), U.S. Government Printing Office, Washington, D.C. 20402, 1961, 149 pp, $0.75.

XV A Reprint of Bulletins 383, 384, 393, and 406 (III, IV, V, and VII), Bulletin 601, Bureau of Mines (Publications Distribution Section, 4800 Forbes Avenue), Pittsburgh, Penna., 1962, 525 pp, single copies free.

383: The Free Energies of Vaporization and Vapor Pressures of Inorganic Substances, K. K. Kelley, 1935.

384: Metal Carbonates, Correlation and Applications of Thermodynamic Data, K. K. Kelley and C. T. Anderson, 1935.

393: Heats of Fusion of Inorganic Substances, K. K. Kelley, 1936.

406: The Thermodynamic Properties of Sulphur and Its Inorganic Compounds, K. K. Kelley, 1937.

Thermodynamic Properties of Chemical Substances, V. P. Glushko et al, eds, Vol. I, 1164 pp, and Vol. II, 916 pp, USSR Academy of Sciences, Moscow, 1962, approx $16.00.

Thermodynamic Constants of Substances, Handbook in 10 parts, V. P. Glushko, ed, USSR Academy of Sciences, All-Union Institute of Scientific and Technological Information, Moscow: Part I, 1965, 146 pp, 72 kopecks ($1.75); Part II, 1966, 96 pp, 52 kopecks ($1.40). Available in the United States from Victor Kamkin, Inc., Bookstore, 1410 Columbia Rd. N.W., Washington, D.C. 20009.

Chemical Thermodynamics in Non-Ferrous Metallurgy, J. I. Gerassimov, A. N. Krestovnikov, and A. S. Shakhov, Metallurgical Publishing House, Moscow.

Vol. I: Theoretical Introduction, Thermodynamic Properties of Important Gases, Thermodynamics of Zinc and Its Important Compounds, 1960, 231 pp.

THERMODYNAMIC PROJECTS (Continued)

Vol. II: Thermodynamics of Copper, Lead, Tin, Silver, and Their Important Compounds, 1960, 231 pp.

Vol. III: Thermodynamics of Tungsten, Molybdenum, Titanium, Zirconium, Niobium, Tantalum, and Their Important Compounds, 1963, 283 pp. English translation available as NASA-TT-F-285 or CFSTI-TT-65-50111, $6.00, from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151.

Vol. IV: Thermodynamics of Aluminum, Antimony, Magnesium, Nickel, Bismuth, Cadmium, and Their Important Compounds, 1966, 428 pp.

Selected Values for the Thermodynamic Properties of Metals and Alloys, Ralph Hultgren, Raymond L. Orr, Philip D. Anderson, and Kenneth K. Kelley, John Wiley & Sons, Inc., New York, N.Y. 10016, 1963, xi + 963 pp, $12.50.

Thermochemistry for Steelmaking, Vol. I, J. F. Elliott and M. Gleiser, Addison-Wesley Publishing Co., Reading, Mass. 01867, 1960, viii + 296 pp, $17.50.

Thermochemistry for Steelmaking, Vol. II: Thermodynamics and Transport Properties, J. F. Elliott, M. Gleiser, and V. Ramakrishna, Addison-Wesley Publishing Co., Reading, Mass. 01867, 1963, xvi + 550 pp (pp 297–846), $25.00.

Thermodynamic Functions of Gases, F. Din, ed, Butterworth & Co. (Publishers) Ltd., 88 Kingsway, London, W.C.2, England, $12.50 per volume.

Vol. 1: Ammonia, Carbon Dioxide, Carbon Monoxide, 1956, viii + 175 pp.

Vol. 2: Air, Acetylene, Ethylene, Propane and Argon, 1956, vi + 201 pp.

Vol. 3: Methane, Nitrogen, Ethane, 1961, vi + 218 pp.

THERMOPHYSICAL PROJECTS

A Compendium of the Properties of Materials at Low Temperatures, V. J. Johnson, ed. Available from Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151.

Phase I, Part I, Properties of Fluids, July 1960, 489 pp, WADD Technical Report 60-56, Part I (PB-171-618), $6.00.

Phase I, Part II, Properties of Solids, Oct. 1960, 330 pp, WADD Technical Report 60-56, Part II (PB-171-619), $4.00.

Phase I, Part III, Bibliography of References (cross-indexed), Oct. 1960, 161 pp, WADD Technical Report 60-56, Part III (PB-171-620), $3.00.

Phase II, R. B. Stewart and V. J. Johnson, eds, Dec. 1961, 501 pp, WADD Technical Report 60-56, Part IV (AD-272-769), $8.10.

Thermophysical Properties Research Center Data Book. Issued as loose-leaf sheets; sold on subscription basis at $0.10 per sheet, Thermophysical Properties Research Center, Purdue University, Research Park, 2595 Yeager Rd., West Lafayette, Ind. 47906.

Vol. I: Metallic Elements and Their Alloys.

Vol. II: Nonmetallic Elements, Compounds and Mixtures (In Liquid and Gaseous States at Normal Temperature and Pressure).

Vol. III: Nonmetallic Elements, Compounds and Mixtures (In the Solid State at Normal Temperature and Pressure).

Handbook of Thermophysical Properties of Solid Materials, A. Goldsmith, T. E. Waterman, and H. J. Hirschorn, revised edition, 1961 (8½″ × 11¼″), The Macmillan Co., 60 Fifth Ave., New York, N.Y. 10011, $90.00 per set.

Vol. I: Elements, vi + 752 pp.

Vol. II: Alloys, vi + 1,270 pp.

Vol. III: Ceramics, vi + 1,162 pp.

Vol. IV: Cermets, Intermetallics, Polymerics and Composites, vi + 798 pp.

Vol. V: Appendix (includes materials, author indexes, and a list of references), 286 pp.

PHYSICOCHEMICAL PROJECTS

Tables of Chemical Kinetics, Homogeneous Reactions, NBS Circular 510, U.S. Government Printing Office, Washington, D.C. 20402, 1951, xxiv + 732 pp (out of print).

Tables of Chemical Kinetics, Homogeneous Reactions, NBS Circular 510, Supplement 1, U.S. Government Printing Office, Washington, D.C. 20402, 1956, xiv + 422 pp (out of print).

Alphabetical Index to Tables of Chemical Kinetics, Homogeneous Reactions, NBS Circular 510, Supplement 2, U.S. Government Printing Office, Washington, D.C. 20402, 1960, iv + 37 pp, $0.35.

Tables of Chemical Kinetics, Homogeneous Reactions, Supplementary Tables, To Accompany Circular 510 and Supplements 1 and 2, NBS Monograph 34, U.S. Government Printing Office, Washington, D.C. 20402, 1961, $2.75.

PHYSICOCHEMICAL PROJECTS (Continued)

Tables of Chemical Kinetics, Homogeneous Reactions, Supplementary Tables, NBS Monograph 34, Vol. 2, U.S. Government Printing Office, Washington, D.C. 20402, 1964, $2.00.

Phase Diagrams for Ceramists, E. M. Levin, H. F. McMurdie, and F. P. Hall, The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, 1956, 286 pp (811 phase diagrams).

Phase Diagrams for Ceramists, Part II, E. M. Levin and H. F. McMurdie, The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, 1959, 153 pp (462 phase diagrams).

Phase Diagrams for Ceramists, E. M. Levin, C. R. Robbins, and H. F. McMurdie (7th compilation), The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, 1964, 601 pp (2064 phase diagrams), $18.00 (discount to members).

Phase Equilibrium Diagrams of Oxide Systems, revised and redrawn by E. F. Osborn and A. Muan, The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, (Ten 19″ × 23″ plates for three-oxide systems containing SiO_2, four of them for oxide phases in equilibrium with metallic iron. Reproductions of these plates appear in the 1964 compilation).

Constitution of Binary Alloys, M. Hansen and K. Anderko, McGraw-Hill Book Company, New York, N.Y. 10036, 1958, xix + 1305 pp, $39.50.

Constitution of Binary Alloys, First Supplement, R. P. Elliott, McGraw-Hill Book Company, New York, N.Y. 10036, 1965, xxxii + 877 pp, $35.00.

Stability Constants of Metal-Ion Complexes, Section I: Inorganic Ligands, compiled by Lars Gunnar Sillen; Section II: Organic Ligands, compiled by Arthur E. Martell; Special Publication No. 17, The Chemical Society, London, 1964, xviii + 754 pp, $23.00.

Solubilities of Inorganic and Metal Organic Compounds, A compilation of Solubility Data from the Periodical Literature, A. Seidell, 4th ed., W. F. Linke, American Chemical Society, 1155 16th St. N.W., Washington, D.C. 20036.

Vol. I, 1958, iv + 1287 pp, $32.50.

Vol. II, 1965, iv + 1914 pp, $32.50.

INDEXES

Consolidated Index of Selected Property Values: Physical Chemistry and Thermodynamics, Prepared by the Office of Critical Tables. A key to the contents of six compilations that present critically evaluated numerical property values. Publication 976, National Academy of Sciences—National Research Council Printing and Publishing Office, 2101 Constitution Ave., N.W., Washington, D.C. 20418, 1962, xxiii + 274 pp, $6.00.

CRYSTALLOGRAPHIC PROJECTS

Crystal Data, Classification of Substances by Space Groups and their Identification from Cell Dimensions, J. D. H. Donnay and Werner Nowacki, Memoir 60 of the Geological Society of America, 1954, ix + 719 pp, Geological Society of America, 419 W. 117 St., New York, N.Y. 10027 (out of print).

Crystal Data, Determinative Tables, second edition, J. D. H. Donnay, General Editor; Gabrielle Donnay, Assistant Editor; E. G. Cox, Inorganic Compounds; Olga Kennard, Organic Compounds; Murray Vernon King, Proteins; Monograph 5 of the American Crystallographic Association, 1963, x + 1,302 pp, $20.00. Polycrystal Book Service, P.O. Box 11567, Pittsburgh, Pa. 15238.

Crystal Structures, first edition, Ralph W. C. Wyckoff, Interscience Publishers, John Wiley & Sons, New York.

Section I: Chapters I to VIII, 1948, 378 pp, $13.50.
Section II: Chapters VIII–X, XIII, 1951, 509 pp, $17.00.
Section III: Chapters XIV, XV, Organic Index, 1953, 465 pp, $25.00.
Section IV: Chapters XI and XII, 1957, 261 pp, $8.00.
Supplement I: Additions to Chapters II to VII, 1951, 143 pp, $5.00.
Supplement II: Additions to Chapter XIII, 1953, 85 pp, $8.50.
Supplement III: Additions to Chapters II to VIII, 1958, 311 pp, $20.00.
Supplement IV: Additions to Chapters IX, X, XIII–XV, 1959, 509 pp, $22.00.
Supplement V: Additions to Chapters II to XV, Indexes, 1960, 513 pp, $26.50.

Crystal Structures, 2nd ed., Ralph W. C. Wyckoff, Interscience Publishers, John Wiley & Sons, New York.

Vol. I: Chapters I–IV, 1963, 467 pp, $17.50.
Vol. II: Chapters V–VII, 1964, 588 pp, $24.00.
Vol. III: Chapters VIII–X, 1965, 981 pp, $27.50.

CRYSTALLOGRAPHIC PROJECTS (Continued)

Powder Diffraction Data File (PD-1), 16 Sets, American Society for Testing and Materials, 1916 Race St., Philadelphia, Pa. 19103.

Sets	Indexes	Cards

22	1958	In preparation	...	.....
23	1959	1965	120	33.50

[a]Index.

A Handbook of Lattice Spacings and Structures of Metals and Alloys, No. 4 of Pergamon Press series of monographs on Metal Physics and Physical Metallurgy. W. B. Pearson, Pergamon Press, Ltd., Headington Hill Hall, Oxford, England, also London, Edinburgh, New York, Paris, and Frankfurt, 1958, x + 1044 pp, $38.00.

International Tables for X-Ray Crystallography, Kathleen Lonsdale, general editor, Published for the International Union of Crystallography by the Kynoch Press, Witton, Birmingham 6, England. Also available from Polycrystal Book Service, P.O. Box 11567, Pittsburgh, Pa. 15238.

Vol. I: Symmetry Groups, Norman F. M. Henry and Kathleen Lonsdale, eds, 1952, xii + 558 pp, £5.5.0. ($14.70).

Vol. II: Mathematical Tables, John S. Kasper and Kathleen Lonsdale, eds, 1959, xviii + 444 pp, £5.15.0. ($16.50).

Vol. III: Physical and Chemical Tables, Caroline H. MacGillavry and Gerard D. Rieck, eds, 1962, xvi + 362 pp, £5.15.0. ($16.10).

The Barker Index of Crystals, A Method for the Identification of Crystalline Substances, Published for the Barker Index Committee by W. Heffer & Sons, Ltd., Cambridge, England.

Vol. I, Crystals of the Tetragonal, Hexagonal, Trigonal and Orthorhombic Systems, M. W. Porter and R. C. Spiller, 1951.

Part 1: Introduction and Tables, ix + 350 pp, £1.10.0. net ($4.20).

Part 2: Crystal Descriptions, x + 1,086 pp, £4.10.0. net ($12.60).
The two parts—£6.0.0. net ($16.80).

Vol. II, Crystals of the Monoclinic System, M. W. Porter and R. C. Spiller, 1956.

Part 1: Introduction and Tables, v + 383 pp.

Part 2: Crystal Descriptions, M.1 to M.1800, viii + 760 pp.

Part 3: Crystal Descriptions, M.1801 to M.3572, viii + 688 pp.
The three parts—£10.0.0. net ($28.00).

CRYSTALLOGRAPHIC PROJECTS (Continued)

Vol. III, Crystals of the Anorthic System, M. W. Porter and L. W. Codd, 1964.

Part 1: Introduction and Tables, vi + 50 pp., and unpaginated tables.

Part 2: Crystal Descriptions, A.1 to A.831 and Atlas of Configurations, vii pp + unpaginated descriptions.

The two parts—£12.0.0. net ($33.60).

MINERALOGICAL PROJECTS

The System of Mineralogy of James Dwight Dana and Edward Salibury Dana, Yale University, 1837–1892, 7th edition, John Wiley & Sons, Inc., 605 Third Ave., New York, N.Y. 10016; and Glen House, Stag Place, London, S.W.1., England.

Vol. I: Elements, Sulfides, Sulfosalts, Oxides; Charles Palache, Harry Berman, and Clifford Frondel, 1944, xiii + 834 pp, $14.00.

Vol. II: Halides, Nitrates, Borates, Carbonates, Sulfates, Phosphates, Arsenates, Tungstates, Molybdates, etc.; C. Palache, H. Berman, and C. Frondel, 1951 xi + 1124 pp, $16.00

Vol. III: Silica Minerals, C. Frondel, 1962, xii + 334 pp, $7.95.

Rock-Forming Minerals, W. A. Deer, J. Zussman, and R. A. Howie, Longmans, Green and Co., Ltd., 48 Grosvenor St., London, W.1, England. Rights in USA, Philippines, and Central America—John Wiley & Sons, Inc., 605 Third Ave., New York, N.Y. 10016.

Vol. I: 1962, 333 pp, $16.50.

Vol. II: 1963, 379 pp, $19.50.

Vol. III: 1962, 270 pp, $16.50.

Vol. IV: 1963, 435 pp, $16.50.

Vol. V: 1962, 371 pp, $16.50.

INDEXES

Indexes to Crystallographic Data Compilations. The American Society for Testing and Materials publishes the following indexes to the Powder Diffraction File (see p. 278). All ASTM publications are available from the American Society for Testing and Materials, 1916 Race St., Philadelphia, Pa. 19103.

a. Index to the Powder Diffraction File; Organic (Hanawalt), includes Section 1–16, PDIS–15o, bound, $15.00.

b. Index to the Powder Diffraction File; Inorganic (Hanawalt), includes Section 1–15, PDIS–16i, bound, $20.00.

c. Fink Inorganic Index to the Powder Diffraction File, PDIS–16f, bound, $15.00.

d. Matthews Coordinate Index to the Powder Diffraction File, Inorganic: Termatrex Cards, $675.00; Negative-Line Cards, $185.00.

GENERAL NUCLEAR PROPERTIES PROJECTS

Nuclear Data Sheets, Jan. 1958—. Vols. 5, and 6, 1958, 1959, 1960, 1961, published by the National Academy of Sciences—National Research Council, 2101 Constitution Avenue, Washington, D.C. 20418. Section B of the new journal "Nuclear Data" will be devoted to Nuclear Data Sheets. Vol. 1, No. 1, containing sheets for A-chains from $A=182$ through $A=185$, was issued in Feb. 1966.

1959 Nuclear Data Tables, U.S. Government Printing Office, Washington, D.C. 20402, April 1959, viii + 151 pp, $1.00.

1960 Nuclear Data Tables, U.S. Government Printing Office, Washington, D.C. 20402.

Part 1: Consistent Set of Q Values, $A \leq 66$, 1961, 214 pp, $1.50.

Part 2: Consistent Set of Q Values, $67 \leq A \leq 199$, 1961, 456 pp, $2.75.

Part 3: Nuclear Reaction Graphs, 1960 (out of print).

Part 4: Short Tables, 249 pp, 1961, $1.50.

Energy Levels of Light Nuclei, May 1962, T. Lauritsen and F. Ajzenberg, issued as Sets 5 and 6 of the 1961 Nuclear Data Sheets, essentially an addendum to a review article in **Nucl. Phys., 11,** 1–340 (1959).

Members of the Nuclear Data Project contributed the section **Energy Levels of Nuclei,** $A=21$ to $A=212$ of Group I, Vol. 1 of the New Series of Landolt-Börnstein, **Numerical Data and Functional Relationships in Science and Technology.**

Table of Isotopes, J. J. Livingood and G. T. Seaborg, **Rev. Mod. Phys., 12,** 30–47 (1940).

Table of Isotopes, G. T. Seaborg and I. Perlman, **Rev. Mod. Phys., 16,** 1–32 (1944).

SOURCES OF CRITICAL DATA (Continued)

GENERAL NUCLEAR PROPERTIES PROJECTS (Continued)

Table of Isotopes, G. T. Seaborg and I. Perlman, **Rev. Mod. Phys., 20,** 585–666 (1948).

Table of Isotopes, J. M. Hollander, I. Perlman, and G. T. Seaborg, **Rev. Mod. Phys., 25,** 469–650 (1953).

Table of Isotopes, D. Strominger, J. M. Hollander, and G. T. Seaborg, **Rev. Mod. Phys., 30,** No. 2, Part 2, 585–904 (1958). Also available from the American Institute of Physics, 335 E. 45th St., New York, N.Y. 10017.

Tabellen der Atomkerne (Nuclear Tables), W. Kunz and J. Schintlmeister. Teil (Part) I, Eigenschaften der Atomkerne (Nuclear Properties); Band (Volume) 1, Die Elemente Neutron bis Zinn (The Elements Neutron to Tin), 1958, xliv + 465 pp, Akademie-Verlag, G.m.b.H., Berlin W.8, Mohrenstrasse 39, Germany, price, 105 DM ($26.25). Teil I, Band 2, Eigenschaften der Atomkerne, Die Elemente Antimon bis Nobelium (Antimony to Nobelium), 1959, xliv + 641 pp (466–1107), price, 130 DM ($32.50). Akademie-Verlag, Berlin. (Also available from Pergamon Press, Headington Hill Hall, Oxford, England; 4/5 Fitzroy Square, London, W.1, England; 122 E. 55th St., New York, N.Y. 10022, £20.0.0 per set.)

Part II, Nuclear Reactions, Vol. 1, The Elements from Neutron to Magnesium, Text Volume, xliv + 700 pp. Table Volume, 36 tables (five of which require 2 or 3 sheets), 1965. Price £25.0.0. ($75.00) for the two volumes.

CROSS-SECTION PROJECTS

Neutron Cross Sections, BNL (Brookhaven National Laboratory) 325, 2nd ed, U.S. Government Printing Office, Washington, D.C. 20402, July 1958, v + 373 pp, $4.50.

Supplement 1, U.S. Government Printing Office, Washington, D.C. 20402, January 1960, iv + 129 pp, $2.00.

Supplement 2, Vol. I, Z=1 to 20, U.S. Government Printing Office, Washington, D.C. 20402, May 1964, Sectional pagination, $2.50.

Supplement 2, Vol. IIA, Z=21 to 40, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, February 1966, sectional pagination, $4.00.

Supplement 2, Vol. III, Z=88 to 98, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, February 1965, sectional pagination, $3.00.

Neutron Cross Sections—Angular Distributions, BNL 400, Clearinghouse for Federal Scientific and Technical Information, Virg. 22151, June 1956, 102 pp.
2nd ed, Angular Distributions in Neutron-Induced Reactions, Vol. I, Z=1 to 22; Vol. II, Z=23 to 94, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, October 1962, 804 pp, sectional pagination, $8.50.

Part I, **Tabulated Neutron Cross Sections,** 0.001–14.5 MeV., R. J. Howerton, Vol. I, $_{1}$H–$_{22}$Ti; Vol. II, $_{23}$V–$_{50}$Sn; Vol. III, $_{51}$Sb–$_{95}$Am; UCRL-5226, first edition, May 1958. UCRL-5226, revised, 1959; Vol. I, $5.00, Vol. II, $5.00, Vol. III, $4.00, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151.

Part II, **Semi-Empirical Neutron Cross Sections,** 0.5–15 MeV., $_{1}$H–$_{94}$Pu, R. J. Howerton, Vol. I, Nov. 1958, UCRL-5351. (Photostat copy, $37.80, Microfilm copy, $11.10, available from the Library of Congress.)

Part III, **Tabulated Differential Neutron Cross Sections,** $_{1}$H–$_{94}$Pu, R. J. Howerton, Vol. I, Jan. 1961, UCRL-5573, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, $5.00.

Charged Particle Cross Sections, LA-2014, Nelson Jarmie and John D. Seagrave, eds, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, Feb. 1957, 234 pp, $1.25.

Charged Particle Cross Sections, LA-2424, Neon to Chromium, Darryl B. Smith, Compiler and ed, Nelson Jarmie and John D. Seagrave, associate eds, Clearinghouse for Scientific and Technical Information, Springfield, Virg. 22151, Jan. 1961, iii + 137 pp, $2.50.

Nuclear Cross Sections for Charged-Particle Induced Reactions, ORNL-CPX-1, Mn, Fe, Co, F. K. McGowan, W. T. Milner, and H. J. Kim, compilers, Oak Ridge National Laboratory, P.O. Box X, Oak Ridge, Tenn. 37831, July 1964, 443 pp.

Nuclear Cross Sections for Charged-Particle Induced Reactions, ORNL-CPX-2, Ni, Cu, F. K. McGowan, W. T. Milner, and H. J. Kim, compilers, Oak Ridge National Laboratory, P.O. Box X, Oak Ridge, Tenn. 37831, Sept. 1964, iii + 511 pp.

ENERGY LEVEL PROJECTS

Energy Levels of Light Nuclei

III: W. F. Hornyak, Thomas Lauritsen, P. Morrison, and H. A. Fowler, **Rev. Mod. Phys., 22,** 291–372, (1950).

IV: F. Ajzenberg and T. Lauritsen, **Rev. Mod. Phys., 24,** 321–402 (1952).

ENERGY LEVEL PROJECTS (Continued)

V: F. Ajzenberg and T. Lauritsen, **Rev. Mod. Phys. 27,** 77–166 (1955).

VI: F. Ajzenberg-Selove and T. Lauritsen, **Nucl. Phys., 11,** 1–340 (1959). This report may be obtained for $10.00 from North Holland Publishing Company, P.O. Box 103, Amsterdam, the Netherlands.

Energy Levels of Light Nuclei, $Z=11$ to $Z=20$

I: P. M. Endt and J. C. Kluyver, **Rev. Mod. Phys., 26,** 95–166, (1954).

II: P. M. Endt and C. M. Braams, **Rev. Mod. Phys., 29,** 683–756 (1957).

III: P. M. Endt and C. van der Leun, **Nucl. Phys., 34,** 1–324 (1962). Reprints of this paper are obtainable for $10.00 from North Holland Publishing Company, P.O. Box 103, Amsterdam, the Netherlands.

Decay Schemes of Radioactive Nuclei, B. S. Dzhelepov and L. K. Peker, 1958, viii + 787 pp, USSR Academy of Sciences Press, Moscow and Leningrad. English translation of above, 1961, vi + 786 pp, Pergamon Press, New York, Oxford, London, Paris.

Decay Schemes of Radioactive Nuclei, $A \geq 100$, B. S. Dzhelepov, L. K. Peker, and V. O. Sergejev, 1963, 1060 pp, USSR Academy of Sciences Press, Moscow and Leningrad.

ATOMIC SPECTRA

Atomic Energy Levels As Derived from the Analyses of Optical Spectra, Charlotte E. Moore, NBS Circular 467, U.S. Government Printing Office, Washington, D.C. 20402.

Vol. I: Hydrogen to Vanadium ($Z=1$–23), 1949, 309 pp, $5.50.

Vol. II: Chromium to Niobium ($Z=24$–41), 1952, 227 pp, $4.00.

Vol. III: Molybdenum to Lanthanum ($Z=42$–57) and Hafnium to Actinium ($Z=72$–89), 1958, 245 pp, $3.00.

Vol. IV: Lanthanide and Actinide groups; in preparation.

An Ultraviolet Multiplet Table, Charlotte E. Moore, NBS Circular 488, U.S. Government Printing Office, Washington, D.C. 20402.

Section 1, 1950, 85 pp, reprinted 1956.

Section 2, 1952, 120 pp, reprinted 1956.
Combined Sections 1 and 2, reprinted 1963, $1.25;

Section 3, 1962, 98 pp, 60 cents.
The first three sections include spectra of the elements in the corresponding volumes of Circular 467.

Section 4, 1962, 70 pp, 45 cents.
A Finding List for spectra of elements in Sections 1 and 2.

Section 5, 1962, 34 pp, 30 cents.
A Finding List for spectra of elements in Section 3.

Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables Si ii, Si iii, Si iv. NSRDS-NBS 3, Section 1, Charlotte E. Moore, U.S. Government Printing Office, Washington, D.C. 20402, June 1965, 40 pp, $0.35.

Atomic Transition Probabilities, A Critical Data Compilation; Vol. I, Hydrogen Through Neon, W. L. Wiese, M. W. Smith, and B. M. Glennon (NSRDS-NBS 4, Vol. I), U.S. Government Printing Office, Washington, D.C. 20402, May 1966, xi + 154 pp, $2.50.

INFRARED AND MICROWAVE SPECTRA

Selected Infrared Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 2813 valid sheets; sold as complete set 7 volumes at $0.30 per sheet, Texas A&M Research Foundation, College Station, Texas.

Selected Infrared Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 342 valid sheets. Sold as complete sets at $0.30 per sheet, Texas A&M Research Foundation, College Station, Texas.

Coblentz Society Spectra, set of 4,000 spectra, 1964, $115 per 1000. Indexes: Alphabetical Index, Molecular Formula Index, Chemical Classes Index, Numerical Index, $5.00 each, set of four, $10.00. Available from Sadtler Research Laboratories, Inc., 1517 Vine St., Philadelphia, Pa. 19102, to whom orders may be sent.

DMS (Documentation of Molecular Spectroscopy) Spectral Cards. The DMS card service is obtained by subscription from Butterworth & Co. (Publishers) Ltd., London, W.C.2, England, from Verlag Chemie, G.m.b.H., Weinheim an der Bergstrasse, West Germany. Volumes 1 through 6 contain 2000 cards, about 80 percent spectral and 20 percent literature. The spectral cards are supplied slotted or unslotted, the unslotted being marked according to the DMS code. The subscription includes a current

literature list in a ring binder, the Junior Index, codes for the literature list, instruction and coding manual for the spectral cards, a formula list for each issue and the newsletters. Literature lists for nuclear magnetic resonance were begun in 1965. The prices for the DMS Spectral and Index cards are as follows:

Cards	Price		
	U.K. (£)	U.S. ($)	W. Germany (DM)
Spectral[a] (volume, each)			
1–4 (unslotted)	67. 0.0.	187.50	750.00
5–8 (unslotted)	75. 0.0.	210.00	840.00
1–4 (slotted)	80. 5.0.	225.00	900.00
5–8 (slotted)	88. 0.0.	247.00	988.00
9– (unslotted)	112.10.0.	315.00	1,260.00
9– (slotted)	130.10.0.	365.00	1,460.00
Index (sets)			
S-1 (1–4999) single	22. 5.0.	62.50	250.00
S-1 (1–4999) multiple	18. 0.0.	50.00	200.00
S-2 (5000–9999) single	26. 5.0.	73.50	295.00
S-2 (5000–9999) multiple	21. 0.0.	59.00	236.00

[a]Each volume consists of four issues, each issue containing about 400 spectral cards (pink) and 100 literature cards (yellow). From Issue 17 (beginning of Vol. 5), spectral cards for inorganic compounds (blue) are included and from Issue 25, the literature cards are replaced by literature lists.

The Infrared Data Committee of Japan Infrared Data Cards, published by Nankodo Co., Ltd., Harukicho, Bunkyo-ku, Tokyo, Japan. They are sold on a subscription basis at $238.00 for 1200 cards (postage included). Asian subscribers receive a special price of $150.00. Export agency is Sanyo Shuppan Bocki Co., Inc., P.O. Box 1705, Tokyo, Central Japan. The agent in the United States is the Preston Technical Abstracts Co., 909 Pitner Ave., Evanston, Ill. 60202. The agent in Europe is Heyden & Son Ltd., Spectrum House, Alderton Crescent, Hendon, London, N.W.4, England.

Standard Infrared Spectra (pure substances), Sadtler Research Laboratories, Inc., 3316 Spring Garden St., Philadelphia, Pa. 19104.

27 volumes of 1000 spectra each (complete through 1965), include alphabetical name, molecular formula, chemical classes, numerical, and commercial alphabetical indexes, $3,500.00 (or each volume $125.00, or indexes, set of five, $50.00).

1966 spectra by subscription, includes 2 volumes of 1000 spectra each, Nos. 27,001—29,000, five indexes and Spec-Finder, $350.00.

Standard spectra on 16-mm microfilm, prices same as above.

Sadtler Standard Grating Spectra, Sadtler Research Laboratories, Inc., 3316 Spring Garden St., Philadelphia, Pa. 19104.

Near Infrared Spectra
Completed set of 2000 spectra in 9 volumes, prices available upon request.

Far Infrared Spectra
Completed set of 500 spectra in 2 volumes, prices available upon request.

Commercial Spectra
Groups priced separately, prices available upon request.
Commercial Spec-Finder, $25.00.

The Red System ($A^2\pi - X^2\Sigma$) of the CN Molecule, Sumner P. Davis and John G. Phillips, University of California Press, Berkeley and Los Angeles, 1963, x + 214 pp, $9.50.

Spectral Data and Physical Constants of Alkaloids, J. Holubek and O. Štrouf, eds. Published by Heyden & Sons, Ltd., London, in cooperation with The Publishing House of the Czechoslovakia Academy of Sciences. Available in Western Europe and the Western Hemisphere from Heyden & Sons, Ltd., Spectrum House, Alderton Crescent, Hendon, London, N.W.4, England.

Vol. I, 1965, spectral cards 1–30 issued in two binders to take Vols. I and II, £23.0.0. ($69.00).

Vol. II, 1966, spectral cards 301–400, punched cards to be inserted in second binder, £7.0.0. ($21.00).

Microwave Spectral Tables, NBS Monograph 70, U.S. Government Printing Office, Washington, D.C. 20402.

Vol. I: Diatomic Molecules, Paul F. Wacker, Masataka Mizushima, Jean D. Peterson, and Joe R. Ballard, Dec. 1, 1964, xviii + 146 pp, 8″ × 10½″, $2.00.

Vol. II: Line Strengths of Asymmetric Rotors, Paul F. Wacker and Marlene R. Pratto, Dec. 15, 1964, xii + 340 pp, 8″ × 10½″, $3.00.

ELECTRONIC SPECTRA (ULTRAVIOLET AND VISIBLE)

Selected Ultraviolet Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 1076 valid sheets. Sold in complete sets, 3 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Selected Ultraviolet Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 126 valid sheets. Sold in complete sets at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Organic Electronic Spectral Data, Interscience Publishers, a division of John Wiley & Sons, Inc., New York, London, and Sydney.

Vol. I, 1946–1952, M. J. Kamlet, ed, 1961, pp xiii + 1244, $25.00.

Vol. II, 1953–1955, H. E. Ungnade, ed, 1960, pp x + 919, $15.00.

Vol. III, 1956–1957, O. H. Wheeler and L. A. Kaplan, eds, 1966, xii + 1210 pp, $25.00.

Vol. IV, 1958–1959, J. P. Phillips and F. C. Nachod, eds, 1963, viii + 1179 pp, $20.00.

The "Sadtler Standard Ultraviolet Spectra" including alphabetical and numerical indexes are available on a subscription basis—$560.00 for the 1965 subscription (5000 spectra). The 11000 bound spectra previously issued sell for $1,265.00 including indexes. Individual spectra are priced at $0.15 each. The spectra are also available on 16-mm microfilm at the same price.

Orders and inquiries should be sent to Sadtler Research Laboratories, Inc., 3314–3320 Spring Garden St., Philadelphia, Pa. 19104.

Absorption Spectra in the Ultraviolet and Visible Region (a Theoretical and Technical Introduction), elaborated and edited by Dr. L. Láng; published in German and English in 1959, 2nd edition, 1961, 3rd edition, 1963, 80 pp, Co-production of the Academic Press, New York and London, and the Publishing House of the Hungarian Academy of Sciences, Budapest. Printed in English in Hungary. Available in both continents of America from Academic Press, Publishers, 111 Fifth Ave., New York, N.Y. 10003.

Absorption Spectra in the Ultraviolet and Visible Region, L. Láng, ed, Co-production of the Academic Press, New York and London, and the Publishing House of the Hungarian Academy of Sciences, Budapest Printed in English in Hungary. Available in both continents of America from Academic Press, Publishers, 111 Fifth Ave., New York, N.Y. 10003.

Vol. 1: Substances, 170, 1959, 414 pp + Index pamphlet, 24, 2nd edition, 1961, 3rd edition, 1963. Combined introduction and Vol. 1, $18.00.

Vol. 2: Substances, 179, 1961, 408 pp + Index pamphlet, 31, 2nd edition, 1964, $18.00.

Vol. 3: Substances, 172, 1962, 424 pp + Index pamphlet, 24, $20.00.

Vol. 4: Substances, 185, 1963, 414 pp + Index pamphlet, 24, $20.00.

Vol. 5: Substances, 192, 1965, 416 pp + Index pamphlet, 28. Cumulative Index, Vols. 1–5, 1965, 112 pp, $23.00.

Vol. 6: Substances, 197, 1966, 412 pp + Index pamphlet, 30, $23.00.

RAMAN SPECTRA

Selected Raman Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 501 valid data sheets. Sold in complete sets, 2 volumes, at $0.30 per sheet, Texas A&M Research Foundation, College Station, Texas.

Selected Raman Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 40 valid sheets. Sold as complete sets at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

MASS SPECTRA

Selected Mass Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 2342 valid sheets in the catalog. Sold as complete sets, 6 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Selected Mass Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 168 valid sheets. Sold as complete sets at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Compilation of Mass Spectral Data (Index de Spectres de Masse), A. Cornu and R. Massot, 1966, xv + 617 pp, 8½″ × 11″. Published by Heyden & Sons Ltd., in cooperation with Presses Universitaires de France. Distributed by Heyden & Sons Ltd., Spectrum House, Alderton Crescent, London, N.W.4, England; $42.00.

NUCLEAR MAGNETIC RESONANCE SPECTRA

Selected Nuclear Magnetic Resonance Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 649 valid sheets. Sold as complete sets, 2 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Selected Nuclear Magnetic Resonance Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 551 valid sheets. Sold as complete sets, 2 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

High Resolution NMR Spectra Catalog, Vol. I, 1962, N. S. Bhacca, L. F. Johnson, and J. N. Shoolery, compilers, Varian Associates, Instrument Division, Palo Alto, Calif. 94303, 43 pp + 368 spectra, $6.00; 10 or more copies, $4.50 each; student price, $5.00.

High Resolution NMR Spectra Catalog, Vol. II, 1963, N. S. Bhacca, D. P. Hollis, L. F. Johnson, and E. A. Pier, compilers, Varian Associates, Instrument Division, Palo Alto, Calif. 94303, x + 62 pp + 332 spectra; price same as Vol. I; combined edition, Vols. I and II, hard cover, $20.00.

Tables of Interatomic Distances and Configuration in Molecules and Ions, L. E. Sutton, scientific ed, Special Publication 11, The Chemical Society, Burlington House, London, W.1, England, 1958, 390 pp, £2.2.0. ($6.00). Also available from Polycrystal Book Service, P.O. Box 11567, Pittsburgh, Pa. 15238.

Tables of Interatomic Distances and Configuration in Molecules and Ions, Supplement, 1956–1959, L. E. Sutton, scientific ed, Special Publication 18, The Chemical Society, Burlington House, London, W.1, England, 1965, 296 pp, £4.4.0. ($12.00). Also available from Polycrystal Book Service, P.O. Box 11567, Pittsburgh, Pa. 15238.

LANDOLT-BÖRNSTEIN

Landolt-Börnstein: Zahlenwerte und Funktionen äus Physik, Chemie, Astronomie, Geophysik und Technik, sixth edition.

Volumes Published

Vol. I: Atom—und Molekularphysik
- Part 1, Atome und Ionen, 1950, xii + 441 pp., DM 126 ($31.50).
- Part 2, Molekeln I: Kerngerüst, 1951, viii + 571 pp., DM 168 ($42.00).
- Part 3, Molekeln II: Elektronenhülle, 1951, xi + 724 pp., DM 218 ($54.50).
- Part 4, Kristalle, 1955, xi + 1,007 pp., DM 318 ($79.50).
- Part 5, Atomkerne und Elementarteilchen, 1952, viii + 470 pp., DM 148 ($37.00).

Vol. II: Eigenschaften der Materie in Ihren Aggregatzuständen
- Part 2, Gleichgewichte ausser Schmelzgleichgewichten.
  - 2a, Gleichgewichte Dampf-Kondensat und Osmotische Phänomene, 1960, xi + 974 pp., DM 448 ($112.00).
  - 2b, Lösungsgleichgewichte I, 1962, x + 983 pp., DM 510 ($127.50).
  - 2c, Lösungsgleichgewichte II, 1964, viii + 731 pp., DM 403.5 ($100.88).
- Part 3, Schmelzgleichgewichte und Grenzflächenerscheinungen, 1956, xi + 535 pp., DM 198 ($49.50).
- Part 4, Kalorische Zustandsgrössen, 1961, xii + 863 pp., DM 438 ($109.50).
- Part 6, Elektrische Eigenschaften I, 1959, xv + 1,018 pp., DM 448 ($112.00).
- Part 7, Elektrische Eigenschaften II, 1960, xii + 959 pp., DM 478 ($119.50).
- Part 8, Optische Konstanten, 1962, xv + 901 pp., DM 476 ($119.00).
- Part 9, Magnetische Eigenschaften I, 1962, xxv + 1,934 pp., DM 496 ($124.00).

Vol. III: Astronomie und Geophysik, 1952, xviii + 795 pp., DM 248 ($62.00).

Vol. IV: Technik
- Part 1, Stoffwerte und mechanisches Verhalten von Nichtmetallen, 1955, xvi + 881 pp., DM 288 ($72.00).
- Part 2, Stoffwerte und Verhalten von metallischen Werkstoffen.
  - 2a, Grundlagen, Prüfverfahren, Eisenwerkstoffe, 1963, xii + 888 pp., DM 468 ($117.00).
  - 2b, Sinterwerkstoffe, Schwermetalle (ohne Sonderwerkstoffe), 1964, xx + 1,000 pp., DM 530 ($132.50).
  - 2c, Leichtmetalle, Sonderwerkstoffe, Halbleiter, Korrosion, 1965, xx + 976 pp., DM 518 ($129.50).
- Part 3, Elektrotechnik, Lichttechnik, Röntgentechnik, 1957, xv + 1,076 pp., DM 396 ($99.00).

Volumes in Preparation

Vol. II: Eigenschaften der Materie in Ihren Aggregatzuständen
- Part 1, Mechanisch-thermische Zustandgrössen.
- Part 5, Physikalische und chemische Kinetik.
- Part 10, Magnetische Eigenschaften II.

Vol. IV: Technik
- Part 4, Wärmetechnik.

LANDOLT-BÖRNSTEIN

Landolt-Börnstein: Zahlenwerte und Functionen aus Naturwissenschaften und Technik, Neue Serie—Numerical Data and Functional Relationships in Science and Technology, New Series, K. H. Hellwege, editor-in-chief.

Volumes Published

Group I: Kernphysik und Kerntechnik—Nuclear Physics and Technology

Vol. I, Energy Levels of Nuclei: A = 5 to A = 257, A. M. Hellwege and K. H. Hellwege, eds., 1961, xii + 813 pp., DM 212 ($53.00).

Group II: Atom und Molekularphysik—Atomic and Molecular Physics

Vol. I, Magnetische Eigenschaften Freier Radikale—Magnetic Properties of Free Radicals, K. H. Hellwege and A. M. Hellwege, eds., 1965, x + 154 pp., DM 68 ($17.00).

Group VI: Astronomie, Astrophysik und Weltraum-Forschung—Astronomy, Astrophysics and Space Research

Vol. I, Astronomie und Astrophysik—Astronomy and Astrophysics, H. H. Voigt, ed., 1965, xxxix + 711 pp., DM 314 ($78.50).

Other groups planned and volumes expected to be published in 1966 or 1967:

Group I: Nuclear Physics and Technology

Hilfstabellen für α-, β-, γ- Spektroskopie—Auxiliary Tables for α-, β-, γ- Spectroscopy.
Ladungs-und Dichteverteilung im Kern—Charge and Density Distribution in the Nucleus.

Group II: Atomic and Molecular Physics

Vol. I, Lumineszenz organischer Molekeln—Luminescence of Organic Molecules.
Mikrowellenspektroskopie von Molekeln—Microwave Spectroscopy of Molecules.
Molekularakustik—Molecular Acoustics.

Vol. II, Magnetische Eigenschaften der Koordinations und metallorganischen Verbindungen der Übergangselemente—Magnetic Properties of Co-ordination and Organometallic Compounds of Transition Elements.

Group III: Crystal and Solid State Physics

Elastische, elastooptische, piezoelektrische und andere Eigenschaften von Einkristallen—Elastic, Elasto-optic, Piezoelectric and Other Properties of Single Crystals.

Group IV: Macroscopic and Technical Properties of Matter

Phosphoreszenz anorganischer Substanzen—Phosphorescence (Luminescence) of Inorganic Substances.

Group V: Geophysics and Space Research

Aeronomy; Cosmic Radiation.

Published by Springer-Verlag, Berlin, Heidelberg, and New York. Also available from Walter J. Johnson, Inc., 111 Fifth Ave., New York, N.Y. 10003, and Stechert-Hafner, Inc., 31 E. 10th St., New York, N.Y. 10003.

TABLES DE CONSTANTES SELECTIONNEES—TABLES OF SELECTED CONSTANTS

Tables de Constantes Sélectionnées—Tables of Selected Constants

Vol. 1. Longueurs d'Onde d'Emissions X et des Ciscontinuités d'Absorption X-Wavelengths of Emission and Discontinuities in Absorption of X-Rays, Y. Cauchois and H. Hulubei, 1947, 199 pp. (out of print).

Vol. 2. Physique Nucléaire—Nuclear Physics, R. Grégoire, F. Joliot-Curie, and I. Joliot-Curie, 1948, 131 pp. (out of print).

Vol. 3. Pouvoir Rotatoire Magnétique (Effet Faraday)—Magnetic Rotatory Power (Faraday Effect); R. de Mallemann, Effet Magnéto-Optique de Kerr—Magneto-Optic Effect (Kerr), F. Suhner, 1951, 137 pp., 15 F, £1.10.0. ($4.50).

Vol. 4. Données Spectroscopiques Concernant les Molécules Diatomiques—Spectroscopic Data for Diatomic Molecules, B. Rosen, R. F. Barrow, A. D. Caunt, A. R. Downie, R. Herman, E. Huldt, A. MacKellar, E. Miescher, and K. Wieland, 1951, 361 pp., 48 F, £5.0.0. ($15.00).

Vol. 5. Atlas des Longueurs d'Onde Caractéristiques des Bandes d'Emission et d'Absorption des Molécules Diatomiques—Atlas of Characteristic Wavelengths for Emission and Absorption Bands of Diatomic Molecules (a continuation of Vol. 4 by the same authors), 1952, 389 pp., 56 F, £5.15.0 ($17.50).

Vol. 6. Pouvoir Rotatoire Naturel I-Steroïdes—Optical Rotatory Powers I-Steroids, J.-P. Mathieu and A. Petit, 1956, 507 pp. (out of print).

Vol. 7. Diamagnétisme et Paramagnétisme—Diamagnetism and Paramagnetism, G. Foëx; Relaxation Paramagnétique—Paramagnetic Relaxation, C. J. Gorter and L. J. Smits, 1957, 317 pp., 97 F, £9.15.9. ($29.00).

Vol. 8. Potentiels d'Oxydo-Réduction—Oxidation-Reduction Potentials, G. Charlot, D. Bézier, and J. Courtot, 1958, 41 pp., 21.60 F, £1.10.0 ($5.00).

Vol. 9. Pouvoir Rotatoire Naturel II-Triterpénoïdes—Optical Rotatory Power II-Triterpenoids, J.-P. Mathieu and G. Ourisson, 1958, 302 pp., 93.60F, £7.0.0. ($21.00)

Vol. 10. Pouvoir Rotatoire Naturel III-Amino-acides—Optical Rotatory Power III-Amino Acids, J.-P. Mathieu, J. Roche, and P. Desnuelle, 1959, 61 pp., 28 F, £2.0.0. ($6.50).

TABLES DE CONSTANTES SELECTIONNEES— TABLES OF SELECTED CONSTANTS (Continued)

Vol. 11. Pouvoir Rotatoire Naturel IV-Alcaloïdes—Optical Rotatory Power IV-Alkaloids, J.-P. Mathieu and M. M. Janot, 1959, 211 pp., 110.40 F, £8.0.0. ($24.00).

Vol. 12. Semi-Conducteurs—Semi-Conductors, P. Aigrain and J. Balkanski, 1961, 78 pp., 27 F, £2.0.0. ($6.50).

Vol. 13. Rendements Radiolytiques—Radiolytic Yields, M. Haïssinsky and M. Magat, 1963, 230 pp., 114 F, £8.10.0. ($25.50).

Vol. 14. Pouvoir Rotatoire Naturel Ia-Stéroïdes—Optical Rotatory Power Ia-Steroids, J. Jacques, H. Kagan, G. Ourisson, and S. Allard, 1965, 1,046 pp., 258 F.

Vol. 15. Données Relatives aux Sesquiterpenoïdes—Data Relative to Sesquiter-penoids, G. Ourisson, S. Munavalli, and C. Ehret, 1966, 70 pp.

In Preparation

Metals of High Purity, 1967

Refractory Compounds

There have been several publishers for the present series. Volume 8 and later volumes have been published by Pergamon Press from whom the earlier volumes as well as the titles, availability, and prices of the 40 installments of Tables Annuelles, covering the period 1931–1936, may be obtained.

Published by Pergamon Press, 4 and 5 Fitzroy Square, London, W.1, England; 122 E. 55th St., New York, N.Y., U.S.; and 24 rue des Ecoles, Paris V^{e}, France.

INTERNATIONAL CRITICAL TABLES

International Critical Tables of Numerical Data, Physics, Chemistry and Technology, published for the National Academy of Sciences—National Research Council, by McGraw-Hill Book Co., 330 W. 42nd St., New York, N. Y. 10036.

Vol. I, 1926, xx + 415 pp.
Vol. II, 1927, xviii + 616 pp.
Vol. III, 1928, xiv + 444 pp.
Vol. IV, 1928, viii + 481 pp.
Vol. V, 1929, ix + 465 pp.
Vol. VI, 1929, x + 471 pp.
Vol. VII, 1930, ix + 507 pp.
Index, 1933, vii + 321 pp.

Seven volumes and Index, $250.00; Vols. I-VII and Index, each $35.00.

Action, definition F66
Active mass, definition F66
Activity coefficient, definition F66
Activity coefficient of acids, bases and salts D93
Acyclic Hydrocarbons, rules for naming C1
Adiabatic, definition F66
Adjusted values of constants F167
Adrenal corticosteroids C691
Adsorption, definition F66
Affinities, electron E70
Air, atmospheric, components of F151
Air columns, frequency of vibration, equations F66
Air dry, density of F66
Air dry density of at 0°, 760 mm A10
Air dry, velocity of sound at 0°C, in A10
Air, index of refraction E224
Air, table for computation of density of moist F9
Alcohol, density at various temperatures F3
Alcohol, methyl, surface tension of, in water F29
Aldaric acids, natural, physical characteristics of C713
Alditols and inositols, physical characteristics of C711
Aldonic acids, natural, physical characteristics of C714
Aldosamines, physical characteristics of C710
Aldoses and ketoses, physical characteristics of C707
Algebra, formulas A244
Algebra, vector A249
Algebraic miscellaneous forms, Integrals A207
Algebraic series: binomial, reversion of, Taylor's, MacLaurin's, exponential, logarithmic, trigonometric, Fourier, Bernoulli Euler formulas A247
Alkali halides, lattic energies of the F165
Alkali metals, electrical resistivity of F141
Allobar, definition F66
Allotropy, definition F66
Allowable carrying capacities for copper and aluminum wire F131
Alloys, high permeability of magnetic E114
Alloys, low melting point F18
Alloys, magnetic, cast permanent E115
Alloys, magnetic, composition and properties of permanent E113
Alloys, melting point and composition of various D102
Alloys, permanent magnetic materials of E119
Alphabet, Greek and Russian F210
Alpha or alpha-ray, particle definition F66
Alternating current, equations F66
Altitude, acceleration of gravity vs., (graph) F151
Altitude, collision frequency vs., (graph) F150
Altitude, density vs., (graph) F149
Altitude, geopotential and geometric, relationship between F147
Altitude mean free path vs., (graph) F150
Altitude mean molecular weight vs., (graph) F149
Altitude mean particle speed vs., (graph) F151
Altitude, pressure vs., (graph) F149
Altitude, speed of sound vs., (graph) F150
Altitude, temperature vs., (graph) F149
Altitudes with the barometer, equations F66
Aluminum and copper wire, safe current, carrying capacities for F131
Aluminum, thermal conductivity of E10
Aluminum wire, cross section, mass, resistance, table F133
American standard abbreviations for scientific and engineering terms F211
Amino acids, densities of crystalline C706
Amino acids, ionization constants in aqueous formaldehyde solution and aqueous ethanol solution C703
Amino acids, properties of C703
Amino acids, solubilities in grams per 100 grams of organic solvent C706
Amino acids, solubilities of, in water C705
Amino acids, solubilities of, in water-ethanol mixtures C705
Amino acids, specific rotations using sodium light C704
Amino sugars, physical characteristics of C707
Ammonia, dissociation constants of aqueous D91

INDEX

Ammonia, NH_3, thermodynamic properties E21
Ammonium hydroxide, concentrated, composition of D92
Amorphous, definition F66
Ampere, definition F100
Ampere's rule F66
Amplitude, definition F66
AMU, definition F67
Anabolic and androgents agents C690; C696
Analysis, Dimensionless Groups for F262
Analysis, vector A249
Analytical geometry, equations A264
Analytical geometry, transformation of coordinates A265
Analytical reagents, organic D71
Androgens and anabolic agents C690; C696
Anesthetic, local, and Diuretic, Antidiuretic agents C691; C696
Angle, definition F67
Angle values and bond lengths between elements F156
Angle values and bond lengths of chemical compounds F156
Angles in degrees and decimals, natural trigonometric functions for A87
Angles, various, value of the functions of A261
Angstrom, definition F67
Angstrom, miscellaneous constant A10
Angular acceleration, definition, equations F67
Angular aperture definition F67
Angular harmonic motion, definition F67
Angular momentum, definition, equation F67
Angular radius of halos and rainbows F151
Angular velocity, definition, equation F67
Anhydride, definition F67
Animal fats and oils, physical and chemical characteristics of D190
Anion, definition F67
Annulus, area of, formula A257
Anode, definition F67
Antiferromagnetic compounds, properties of E117
Antiferromagnetic materials, definition F100
Antilogarithms, four-place, table A16
Aperture of an object, angular, definition F76
Apochromat, definition F76
Apparatus, volumetric, glass, temperature correction for F3
Approximate brightness of various light sources E196
Approximate pH values D80
Approximations, formula A247
Aqueous solutions, acids, heat capacity of D54
Aqueous solutions at 25° for diffusion coefficients F47
Aqueous solutions, concentrative properties of D143
Aqueous solutions, index of refraction E224
Aqueous solutions, of organic bases, dissociation constants of E93
Aqueous solutions, standard, pH of, at 25°C D78
Aqueous solutions, vapor pressure, lowering by salts in E1
Aqueous vapor, pressure of D108
Aqueous vapor, saturated, weight in grams of a cubic meter E32
Arc, length of, formula A257
Arc to time, conversion of angles A122
Archimedes principle, equation F67
Area and volume of a spherical segment, formulas A258
Area of a circle A257
Area of a lune, formula A258
Area of a triangle, equations A264
Area of circles, numerical table A124
Area of geometrical figures, formulas A256
Area of spherical polygon, formulas A259
Area of spherical triangle, formulas A258
Area of the ring between two circles, formula A257
Area, unit of, definition F67
Areas, ordinates and derivatives of the normal curve of error A158
Areas, Simpson's rule for irregular A259
Argon, liquid, thermal conductivity of E11
Arithmetical progression, formulas A245
Arrangement of electrons in orbits B2
Arrhenius' theory of electrolytic dissociation F67
Astigmatism, definition F67
Astronomical data F144
Atmosphere, ICAO, metric table F148
Atmosphere, ICAO, sea-level values F147
Atmosphere, sea-level atmospheric composition for dry F147
Atmosphere, standard F146
Atmospheric air, components of F151
Atmospheric and meteorological data F145
Atmospheric electricity F151
Atom, definition F67
Atom, hydrogen, mass of A10
Atomic bomb, definition F67
Atomic energy, definition F67
Atomic energy levels E175
Atomic mass, definition F67
Atomic mass of electron, numerical value F165
Atomic mass of hydrogen, numerical value F165
Atomic mass of proton, numerical value F165

Atomic mass, values of the Isotopes B4
Atomic number, definition F67
Atomic number, Isotopes listed by B4
Atomic numbers and weights of the elements B1; B97
Back end sheet
Atomic specific heat constant, numerical value F165
Atomic structure, definition F68
Atomic theory, definition F68
Atomic weight, definition F68
Atomic weights, table ..... B1; back end sheet
Atomic weights and numbers of the elements B1; B97
Back end sheet
Atoms, gaseous heats of formation of F162
Auxiliary formulas for Fourier series A249
Average daylight, filters for E247
Average amounts of the elements in the Earth's crust in grams per metric ton or parts per million F144
Avogadro's law F68
Avogadro's number, definition F68
Avogadro's number, numerical value F165
Avogadro's number, misc. constants A10
Avogadro's theory or principle, definition F68
Azeotropes, table of D1

B

Babo's Law F68
Balance, sensitiveness of, equation F92
Balance, with unequal arms, equation F85
Balmer series F68
Bands and lines, wave lengths of, for Flame Spectra E198
Bar, definition F68
Barn, definition F68
Barometer, altitudes with the, equations F66
Barometer, reduction to latitude 45° E35
Barometer, to gravity at sea level, reduction of E33
Barometric and hygrometric tables E29
Barometric corrections for molecular elevation of boiling points of various substances D104
Barometric pressure at various heights above sea-level F145
Barometric readings, conversion table for E29
Barometric readings, temperature correction for, brass scale, English units E31
Barometric readings, temperature correction for, brass scale, metric units E30
Barometric readings, temperature correction for, glass scale, metric units E32
Barye, definition F68
Barye, unit of pressure, definition F68; F90
Baryons F190
Base of logarithms, change of, equation A9
Base of natural logarithms A9
Bases, acids and salts, activity coefficient of D93
Bases, approximate pH Values D80
Bases, definition F68
Bases, inorganic, dissociation constants of, in aqueous solutions D89
Bases, optical rotation of E248
Bases, organic, dissociation constants of, in aqueous solutions D87
Basic thermodynamic properties of the elements and oxides, explanation of tables D32
Baumé hydrometer scale, conversion tables F3
Bead and flame tests D59
Beads of microcosmic salt D59
Beat frequencies, definition F69
Beat(s), definition F68
Beer's law, definition F69
Bernoulli and Euler numbers A249
Bernoulli's theorem, equations F69
Berthelot's principle of maximum work F69
Bessel functions for spherical coordinates A232
Bessel functions, hyperbolic A233
Bessel functions $J_0(x)$ and $J_1(x)$ A232
Beta-particle (Beta-ray) definition F69
Betatron, definition F69
Bevatron, definition F69
Binary system, table of Azeotropes D1
Binomial coefficients, formulas and table A252
Binomial formulas, algebraic, series A247
Binomial series A247
Biologic materials, pH values D80
Birmingham wire gauge F129
Black body, definition F69
Black's ice calorimeter, equation F93
Bohr's atomic theory, definition F69
Boiling and melting points of the elements D103
Boiling and triple points of some low boiling elements D103
Boiling point, molecular elevation of D104
Boiling point of inorganic compounds B172

PAGE
Boiling point of organic compounds, index C643
Boiling point of water (hydrogen scale) D102
Boiling points, correction to standard pressure D105
Bond lengths and angles between elements F156
Bond lengths and angles of chemical compounds, A, inorganic compounds; B, organic compounds F156
Bond lengths between carbon and other elements F154
Bond lengths between carbon-carbon F154
Bond lengths between carbon-hydrogen F154
Bond lengths between carbon-nitrogen F154
Bond lengths between carbon-oxygen F154
Bond lengths between carbon-sulphur F154
Bond lengths of elements F154
Bond strengths in diatomic molecules F158
Bond strengths in polyatomic molecules F163
Bond strengths of some organic molecules F165
Bonds, chemical, strengths of F158
Borax bead tests D59
Borides, refractory materials D28
Boyle's law for gases, definition, equation F69
Brazing filler metals, solders F142
Breeder, reactor, definition F69
Brewster's law F69
Bridged Heterocyclic compounds, rules for naming C44
Brightness, definition F69
Brightness of tungsten E197
Brightness of various light sources E196
British standard guage for wire F130
British thermal unit (b.t.u.) F69
Brown and Sharpe guage, dimensions of wire F131
Brown and Sharpe, resistance of wires, per unit F135
Brownian movement, definition F69
Buffer solutions, operational definition of pH D78
Buffer solutions, properties of standard aqueous at 25°C D78
Buffer systems, approximate pH values D79
Buffers, pH values of certain solutions D80
Buffers, pH values of certain solutions from 0 to 95°C D80
Building materials, sound absorption of E40
Bulk modulus, equation F69
Bunsen's ice calorimeter, equation F93
Bushel (U.S.) conversion factors A8
Butane, thermodynamic properties of E25

C

Cadmium light, red, absolute wave length of A10
Calcite, index of refraction E223
Calcium carbonate, dissociation pressure of F64
Calibration, spectroscope, wave lengths E197
Calibration table for chromel-alumel thermocouples E104
Calibration table for iron-constantan thermocouples E107
Calibration table of temperature-E.M.F. values for copper-constantan E109
Calibration tables for thermocouples, standard E103
Calorie, definition F69
Calorimeters, equation F93
Calutron, definition F70
Candela, definition F101
Candle, new unit, definition E196
Candle (or International Candle), definition E196
Candlepower, spherical, definition E196
Cane sugar (sucrose) index of refraction of aqueous solutions E225
Capacitance, definition, equations F70
Capacitance, Farad, definition F101
Capacity of glass vessels, corrections for D75
Capacity of glass vessels from weight of contained water or mercury D75
Capillary constant, equation F70
Capillary tubes, equation F95
Carbides, refractory materials D28
Carbohydrates, physical characteristics of C707
Carbon and other elements, bond lengths between F154
Carbon bisulfide, index of refraction at various temperatures E223
Carbon dioxide, thermodynamic properties of E23
Carbon dioxide, vapor pressure of D111
Carbon disulfide, thermodynamic properties of E26
Carbon, tetrachloride, liquid, thermal conductivity of E11
Carbon tetrachloride, thermodynamic properties of E23
Carcel unit, photometric, definition E196
Carnot cycle, definition F70
Carrying capacities for copper and aluminum wire F131
Cast permanent magnetic alloys E115
Catalytic agent, definition F70
Cathode definition F70
Cation, definition F70
Cauchy's dispersion formula F70
Celsius temperature scale, definition F95
Celsius temperatures, reciprocals of F238
Centigrade degree, definition F95
Centigrade temperatures, reciprocals of F238
Centigrade to Fahrenheit conversion table F104
Centimeter, conversion factors A8
Centipoise, definition F70
Central measures (statistics) A253
Centrifugal force, definition F70
Centripetal force, definition F70
Ceramics material, dielectric properties of E63
Ceramics material, thermal conductivity data on E4
Cesium metals, electrical resistivity of F141
CGS system of units F208
Chain reactions, definition F70
Change of base of logarithms, equation A9
Characteristic frequencies between 700–300 cm-1 chart of F177
Characteristic NMR spectral positions for hydrogen in organic structures F187
Charles' law for gases, definition F70
Charts:
I.R. Charts-infrared correlation charts F168
Far I.R., Far infra-red vibrational frequency correlation F175
Characteristic frequencies between 700–300 cm-1 ..... F177
Characteristic NMR spectral positions for hydrogen in organic structures F187
Chemical bonds, strengths of F158
Chemical composition of the Earth's crust F144
Chemical composition of rocks F144
Chemical compounds, bond lengths and angles of F156
Chemical designation, Isotopes listed by B4
Chemical equilibrium, definition F77
Chemical hazards in fires and fire precautions xxvi
Chemical physics, recommended symbols for F203
Chemiluminescence, definition F70
Chemistry and physics abbreviations and symbols F191
Chi–square table, explanation A160
Chord, length of A257
Christiansen effect F70
Chromatic aberration, definition F71
Chromatic scale, equal tempered E39
Chromel-alumel thermocouples calibration table E104
Circle, area of, formula A257
Circles, area and radius of inscribed and circumscribed, table, formulas, for regular polygons A256
Circles, equations of A264
Circles, mensuration formulas for A257
Circles, numerical table for circumference and area A124
Circular functions, exponential definitions A261
Circular motion, uniform, equations F97
Circumference of a circle, formula A257
Circumference of circles, numerical tables A124
Circumscribed circles, formulas, table A256
Circumscribed polygons, area and perimeter formulas A256
Citations, vapor pressure, for inorganic compounds D118
Classical radius of electron, numerical value F165
Class intervals, formulas A255
Cloud chamber, definition F71
Coefficient of absorption of solar-radiation E227
Coefficient of absorption, definition F65
Coefficient of friction, table F15
Coefficient of restitution, definition F92
Coefficient of restitution, equation F75
Coefficient of thermal expansion, definition F96
Coefficient of transparency of uviol glass for ultra-violet E224
Coefficients, diffusion in aqueous solutions at 25° F47
Coefficients diffusion, of strong electrolytes F47
Coefficients diffusion, of weak and non-electrolyte F47
Coefficients in free-energy equations, inorganic oxides D22
Coefficients (mass absorption) for X and γ rays E133
Coefficients of reflection of miscellaneous surfaces for monochromatic radiation in the visible spectrum E227
Coefficients of reflection of surfaces for incandescent light E227
Colligative property, definition F71
Collision frequency of gas molecules F151
Collision frequency vs., altitude, graph F150
Colloid, definition F71
Color code for resistors F137
Color of inorganic compounds B172
Color of minerals B301
Color of organic compounds C75
Colorations, flame D59
Colored glasses, transmission of E229
Colorimetry E247
Coma, definition F71
Combination frequencies, definition F71
Combination, algebraic, formulas A245
Combination of lenses, equation F83

Combining volumes, definition F71
Combining volumes, Gay-Lussac's law of F79
Combining weight, definition F71, F77
Combining weights, law of F71
Combustion, heat, for organic compounds D184
Common fractions to decimal equivalents, conversion table A11
Common logarithms of decimal fractions, four-place A14
Commoner chemical elements in the Earth's crust F144
Comparison of hardness values of various materials on Mohs and Knoop scales F18
Comparison of wire gauges F129
Compensation point, definition F101
Complete conversion factors F214
Complete elliptic integrals, formula A267
Complete elliptic integrals, table A166
Complex compounds, inorganic, rules for naming B148
Component substances, law of F71
Components of atmospheric air F151
Composition and properties of alloys, magnetic E113
Composition of some inorganic acids and bases D92
Composition of stainless and heat resisting steels F127
Composition of the Earth's crust F144
Composition of vectors, equation F98
Composition, trade names and manufacturers of some plastics C719
Compounds, definition F71
Compounds, diamagnetic susceptibilities of organic E124
Compounds, inorganic physical constants of B172
Compounds, organic physical constants of C75
Compounds, organometallic, physical constants of C650
Compounds, organic ring, names and numbering C50
Compressibility, definition F71
Compressibility, isothermal, of liquids F12
Compressibility of ordinary water F5
Compton effect, definition F71
Compton wave length of electron, numerical value E208
Compton wave length of proton, numerical value E208
Computation for product-moment coefficient of correlation A254
Computation for rank-difference coefficient of correlation A255
Computing probable errors, factors of A156
Computing probable errors, factors for, explanation A7
Concentrated inorganic acids and bases, composition of D92
Concentration, aqueous solution D143
Concentration, definition F71
Concentration, laboratory reagents D60
Concentrative properties of aqueous solutions D143
Condensers, capacitances of, formulas F71
Condensers, in parallel and series, capacitances of, equations F71
Conductance, definition F71
Conductance, equivalent, of the separate ions D93
Conductance, equivalent, of some electrolytes in aqueous solutions D93
Conductance of heat, definition, equation F71
Conductivity data on ceramic materials, thermal E5
Conductivity, electrical, definition F71
Conductivity, thermal, definition, equation F71
Conductivity, thermal, of certain metals E10
Conductivity, thermal, of glasses E6
Conductivity, thermal of dielectric crystals E4
Conductivity, thermal, of various commercial insulating materials E5
Conductivity, thermal, of various gases E2
Conductors, definition F72
Conductors, semi, properties of E97
Cone, surface and volume, formulas A259
Configuration of the elements, electronic, table B2
Conjugate, foci, definition F72
Conservation of energy, definition F72
Conservation of energy, law of F72
Conservation of mass, definition F72
Conservation of momentum, law of F72
Constant boiling mixtures, table of Azeotropes D1
Constant, gas A10
Constant heat summation, Hess' law of F81
Constant humidity E37
Constant of gravitation A10
Constant, Planck's A10
Constants, adjusted values of F167
Constants dielectric E58
Constants dielectric, of gases at 760 mm pressure E62
Constants dielectric, of pure liquids E58
Constants dielectric, of solids E61
Constants dielectric, reference gases E61
Constants, dissociation, of aqueous ammonia D91
Constants, for gases, Van der Waals' D107
Constants for satellite geodesy F167
Constants, general physical, values of F167
Constants, ionization, of acids in water at various temperatures D92
Constants, miscellaneous, physical A10
Constants, molecular, of gases F151

Conversion factors, U.S. and metric units A8
Conversion hydrometer tables F3
Conversion of angles from arc to time A122
Conversion table, centigrade to Fahrenheit F104
Conversion table, centimeters to millibars E29
Conversion table, common fractions to decimal equivalents A11
Conversion table, degrees, minutes and seconds to radians A121
Conversion table, degrees and decimal fractions to radians A121
Conversion table, degrees-radians, radians to degrees A118
Conversion table, factors F214
Conversion table, minutes and seconds to decimal parts of a degree A123
Conversion table, radians to degrees A118
Conversion table (condensed) A8
Conversion table, radians to degrees, minutes and seconds A121
Conversion table, transparency to optical density E251
Conversion table, U.S. inches to centimeters } Barometer E29
Conversion table, U.S. inches to millibars } Readings E29
Conversion table, viscosity F34
Conversion tables, concentrative properties of aqueous solutions D143
Cooling, definition F72
Cooling, Newton's law of, definition F87
Coordinate system, standard, of colorimetry E247
Coordinates, spherical, Bessel functions for A232
Coordinates, transformation of A265
Copper and aluminum wire, safe current, carrying capacities for F131
Copper-constantan, calibration table of temperature-E.M.F. values for E109
Copper, standard annealed, wire table F131
Copper, thermal conductivity of E10
Copper wire, dimensions, mass and resistance F131
Correction for anomalous moment of the electron, numerical value F165
Correction for capacity of glass vessels, table D75
Correction of boiling points to standard pressure D105
Correction, temperature, for glass volumetric apparatus F3
Correction, temperature, for volumetric solution F2
Correlation chart, far infrared, vibrational frequency F175
Correlation charts, infrared F168
Correlation, formulas A254
Cosine finite transforms, Fourier A236
Cosine, sine and exponential integrals A233
Cosmic rays, definition F72
Cosmotron, definition F72
Coulomb, definition F71; F101
Coulomb, unit of quantity of electricity, definition F72
Coulomb's law, force between two charges, definition F78
Couple acting on a magnet, equations F72
Couple, definition F72
Critical Data, Sources of F275
Critical mass F72
Critical temperature, definition F72
Critical temperatures and pressures of some organic and inorganic compounds F63
Critical X-ray absorption energies in Kev E189
Cross product or vector of vectors V_1 and V_2 ..... A250
Cross section (nuclear cross section) definition F72
Cross section and mass of wire, various metals F134
Cross section and mass of wire, U.S. measure and metric measure F134
Cross sections, thermal neutrons B93
Cryohydrate, definition F72
Crystal, definition F72
Crystal ionic radii of elements F152
Crystalline form and color of inorganic compounds B172
Crystalline form and color of minerals B301
Crystalline form, color and specific rotation of organic compounds C75
Crystals, dielectric, thermal conductivity of E3
Crystals, grating space in kX units E191
Cubes of numbers A245
Cubes, roots and squares, table of A134
Cubic centimeter, conversion factors A8

Dew-point, definition F73
Dew-point, relative humidity E35
Diamagnetic materials, definition F72; F100
Diamagnetic susceptibilities of organic compounds E124
Diamagnetic susceptibility of organic compounds, supplementary table E130
Diameter of gas molecules F151
Diatomic molecules, bond strengths of F158
Dielectric constant, equation, definition F73
Dielectric constant of deuterium oxide E64
Dielectric constant of liquid parahydrogen E65
Dielectric constant of water E64
Dielectric constants of gases at 760 mm pressure E62
Dielectric constants of pure, inorganic and organic liquids, solids, gases E58
Dielectric constants of reference gases E61
Dielectric crystals, thermal conductivity of E3
Dielectric properties of Ceramics, Glasses, Plastics, Waxes E63
Differences, finite A252
Differential equations A238
Differential operators-rectangular coordinates A250
Differentiation of vectors A250
Diffraction data for cubic isomorphs E192
Diffraction, definition F73
Diffraction grating, equations F73
Diffusion coefficients in aqueous solutions at 25° F47
Diffusion coefficients of strong electrolytes F47
Diffusion coefficients of weak and non-electrolytes F47
Diffusion of gases into air F47
Diffusion of metals into metals F55
Diffusion of solute elements in body centered cubic titanium and titanium alloys F56
Diffusion, self, of tracers in metals F48
Diffusivity, equation F74
Diffusivity of heat, equation F74
Diflurodichloromethane, thermodynamic properties of E26
Dilution, heat of, of acids D52
Dimensional formulas explained F74
Dimensionless groups F262
Dimensionless groups, nomenclature of F262
Dimensions of wire F130
Dimensions of wire, B. and S. gauge, mass and resistance for copper F134
Diminution of pressure at the side of a moving stream, equation F74
Dip, definition F74
Diphenyl, liquid, thermal conductivity of E11
Dipole, definition F74
Dipole moment, molecular, definition F74
Dipole moments, electric, of molecules in the gas phase E66
Dipole moments of inorganic gases, organic substances, amides, amino acid esters, some hormones and related compounds in dioxan E69
Dipoles, electric, Langevin function E112
Dipoles, magnetic, Langevin function E112
Discoveries of the elements B97
Dispersion and skewness, measures of A253
Dispersion, definition F74
Dispersion forces, definition F74
Dispersion formulas, statistics A253
Dispersive power, equation F74
Displacement, definition F74
Displacement in oscillatory motion, definition F74
Dissociation constants, for deuterium oxide D92
Dissociation constants (k_b) of aqueous ammonia from 0 to 50°C. D91
Dissociation constants of inorganic acids in aqueous solutions D91
Dissociation constants of inorganic bases in aqueous solutions D89
Dissociation constants of organic acids in aqueous solutions D90
Dissociation constants of organic bases in aqueous solutions D87
Dissociation, electrolytic, Arrhenius' theory of F67
Dissociation pressure of calcium carbonate F64
Distance between two points, equations A264
Distribution coefficients for equal energy spectrum E247
Distribution law F74
Diuretic, antidiuretic and local anesthetic agents C691
Dopper effect (light), definition F74
Doppler effects F74
Dosimeter, definition F75
Dot, Scalar, or inner product of two vectors V_1 and V_2 ..... A250
Double decomposition, definition F75
Double layer theory, Helmholtz F76
Drill gauge, sizes F130

Fused quartz, index of refraction E224
Fusion, (atomic) definition F79
Fusion, heat equivalent of, definition F80
Fusion of water 0°C, heat of A10

G

Gal., definition F79
Galvanometer, tangent, equations F95
Gamma energies (MeV), Table of Isotopes B4
Gamma function A232
Gamma intensities, Table of Isotopes B4
Gamma-rays, definition F79
Gamma-rays, mass absorption coefficients E133
Gas constant A10
Gas, definition F79; F97
Gas, inflammability of, in air D57
Gas, inflammability of, in oxygen D58
Gas thermometer, equation F79
Gaseous atoms, heats of formation of, from their elements F162
Gases at 760 mm pressure, dielectric constants of E62
Gases, diffusion of, into air F47
Gases, index of refraction E224
Gases, kinetic theory of F83
Gases, molecular constants of F151
Gases, reference, dielectric constants of E58
Gases, thermal conductivity of various E2
Gases, Van der Waals', constants for D107
Gases, velocity of sound in E38
Gases, viscosity of F43
Gauges, wire, comparison of F129
Gauss, definition F79
Gauss, unit of magnetic flux, definition F85
Gay-Lussac's law of combining volumes F79
Gay-Lussac's law for gases F79
Geiger counter, definition F79
General law for gases, equations F77
General methods for evaluating coefficients A247
General physical constants, values of F167
Geodesy, satellite, constants for F166
Geologic information F145
Geometrical progression, formulas A245
Geometry, analytical, equations A265
Geopotential and geometric altitude, relationship between F147
Gibb's phase rule, definition F79
Gilbert, definition F80
Gilbert, unit of magnetic potential, definition F85
Glasses, colored, transmission of E229
Glasses, Jena, transmission of colored E233
Glasses of American manufacture, transmission of colored glasses E229
Glasses, thermal conductivities of E6
Glass, index of refraction of E223
Glass scale, temperature correction, metric units E32
Glass sealing material, physical properties of F138
Glass transmissibility for radiations E246
Glass, uviol, coefficient of transparency, for the ultra-violet E224
Glass vessels, corrections for capacity of, table D75
Glass vessels, true capacity of D75
Gold, thermal conductivity of E10
Graham's law F80
Gram atom or gram atomic weight, definition F80
Gram equivalent, definition F80
Gram molecular weight or gram molecule, definition F80
Gram mole, gram formula weight, gram equivalent, definition F80
Gram unit of mass, definition F85
Graphs of the trigonometric functions A260
Grating, diffraction, equations F73
Grating space in crystals in kX units E191
Gravimetric factors and their logarithms B266
Gravimetric factors reciprocals of B266
Gravitational constant, Gaussian, defining the a.u. F166
Gravitational constant, geocentric F166
Gravitation, constant of A10
Gravitation, definition, equation F80
Gravity acceleration, dimensionless groups for F262
Gravity, acceleration due to F144
Gravity at sea level, acceleration due to A10
Greek and Russian alphabet F210
Greek letter symbols F191
Green's Theorem formula A251
Groups, Dimensionless F262
Gudermannian function, relation to hyperbolic A267

H

Half-life, definition F80
Half-lives of the elements B4
Halides, lattice energies F165

PAGE

Hall effect F80
Halos and rainbows, angular radius of F151
Hardness, definition F80
Hardness, Mohs' scale of F18
Hardness of materials F18
Hardness of minerals B301
Hardness value of various materials on Mohs and Knoop scales, comparison F18
Harmonic motion, angular, definition F80
Harmonic motion, equations, simple F92
Haversiness, table A93
Haversiness, use of table A6
Heat capacity, definition F80
Heat capacity of air-free water 0°–100°C D94
Heat capacity of aqueous solutions of acids D54
Heat capacity of mercury D95
Heat capacity of some organic compounds D96
Heat capacity, specific heat D94
Heat content of water above 100°C D95
Heat effect of electric current, equation F8
Heat, fluxes, dimensionless groups for F262
Heat of combustion definition F80
Heat of combustion of organic compounds D184
Heat of dilution of acids D52
Heat of formation for organic compounds D189
Heat of formation, standard, table D38
Heat of fusion, equivalent or latent heat, definition F80
Heat of fusion of water 0°C A10
Heat of sublimination of some organic compounds C686
Heat of transition of elements D33
Heat of transition of oxides D35
Heat of vaporization, definition F83
Heat of vaporization of elements D33
Heat of vaporization of various substances E21
Heat of vaporization of water 100°C A10
Heat quantity, definition F80
Heat resisting steels, composition of F127
Heat specific, and enthalpy of some solids at low temperatures D99
Heat specific of the elements D97
Heat specific of ice D95
Heat specific of super-heated steam D95
Heat specific of transfer, dimensionless groups for F262
Heats of formation of free radicals F164
Heats of formation of gaseous atoms from their elements F162
Heats of formation, standard of hydrocarbons D51
Heats of solution of uni-univalent electrolytes D53
Heavy liquids for mineral separation E219
Heavy water dielectric constant of E64
Heavy water, density of F4
Heavy water, ionization constants for D92
Hefner units, definition E196
Hefner units, photometric F84
Hehner number, value F80
Heisenberg's theory of atomic structure, definition F80
Helium, gaseous, thermal conductivity of E3
Helium, Lambda point of D103
Helium liquid, thermal conductivity of E11
Helmert's equation F65
Helmholtz double layer theory F76
Henry's law F81
Henry, unit of inductance definition F82; F101
Hess' law of constant heat summation F81
High permeability magnetic alloys E114
High permeability magnetic materials E118
High silicon transformer steel E118
Hooke's law F81
Hormones and related compounds in dioxan, dipole moments of E69
Hormones, steroid and other steroidal synthetics C690
Humidity, absolute F81
Humidity, constant E37
Humidity from wet and dry bulb thermometer readings E36
Humidity, relative F91
Humidity, relative dew-point E35
Huygen's theory of light, definition F81
Hydrocarbons, section A, definitive rules for nomenclature of organic chemistry C1
Hydrocarbons, thermodynamic, properties of D51
Hydrogen atom, mass of A10
Hydrogen equivalent, definition F81
Hydrogen equivalent of various oxidation and reduction reagents D70
Hydrogen equivalent of various salts and reagents D68
Hydrogen ion concentration, definition F81
Hydrogen scale, boiling point of water D102
Hydrolysis, definition F81
Hydrometer conversion tables F3
Hydrometers and density units F3
Hydrometric and barometric tables E29
Hydrostatic pressure, equations F81

Inorganic compounds, abbreviations used in table of physical constants of ... B171
Inorganic compounds and elements, magnetic susceptibility of ... E119
Inorganic compounds, index of refraction ... B172
Inorganic compounds, physical constants of, general table ... B172
Inorganic compounds, solubility in water and acid (for qualitative analysis) ... D76
Inorganic compounds, thermal conductivity of ... E4
Inorganic compounds, vapor pressure citations ... D118
Inorganic compounds, vapor pressure greater than one atmosphere ... D117
Inorganic compounds, vapor pressure less than one atmosphere ... D112
Inorganic compounds, vapor pressure variation with temperature ... D139

PAGE

Inorganic liquids, dielectric constants of ... E58
Inorganic oxides, heat of formation of ... D22
Inorganic solutes in organic solvents, surface tension of ... F28
Inorganic solutes in water, surface tension of ... F28
Inositols and alditols, physical characteristics of ... C707
Inscribed circles, formulas, table ... A256
Inscribed polygons, area and perimeter ... A256
Insulating materials, thermal conductivity of ... E5
Insulators, definition ... F73
Integers, sum of powers of ... A244
Integrals, complete elliptic, formula ... A267
Integrals, complete elliptic, table ... A166
Integrals, elementary forms ... A191
Integrals, elliptic, of the first and second kind ... A167
Integrals, elliptic, of the first kind; $F(k, \phi)$ ... A168
Integrals, elliptic of the second kind; $E(k, \phi)$ ... A170
Integrals, exponential forms ... A218
Integrals, forms involving inverse trigonometric functions ... A214
Integrals, forms involving trigonometric functions ... A208
Integrals, forms involving trigonometric substitutions ... A216
Integrals, logarithmic forms ... A217
Integrals, miscellaneous algebraic forms ... A207
Integrals of hyperbolic forms ... A221
Integrals, sine, cosine and exponential ... A233
Integrals, Tables ... A185
Integration ... A185
Intensity, luminous, definition ... F84
Intensity, of electric field, definition, equations ... F75
Intensity of illumination ... F82
Intensity of magnetization, definition ... F82
Intensity of radiation, definition ... F82
Intensity of sound, definition, equation ... F82
Intermetallic compounds, rules for naming ... B148
International ampere, definition ... F73
International Atomic Weights ... B1; back end sheet
International candle, definition ... E196; F70
International candle, unit of luminous intensity, definition ... F70; F84
International Knot ... A10
International nautical mile ... A10
International ohm, unit of resistance, definition ... F91
International system units, definition of certain ... F101
International volt, definition ... F76
Interplanetary orbits, Tables A and B ... F146
Inverse hyperbolic functions ... A267
Inverse trigonometric functions, integrals, forms involving ... A214
Inverse trigonometric functions ... A262
Invert sugar, specific gravity of aqueous solutions of ... D183
Iodine number, definition ... F82
Ion, definition ... F82
Ionic radii, crystal, of elements ... F152
Ionization constant for water (K_w) ... D92
Ionization constant for deuterium oxide ... D82
Ionization constants of amino acids ... C703
Ionization constants of acids in water at various temperatures ... D92
Ionization potential, definition ... F82
Ionization potentials of the elements ... E71
Ionization theory ... F78
Ion product constant ... B307
Ions, equivalent conductance of ... D93
Iron-constantan thermocouples calibration table ... E107
Iron, high purity, initial permeability at various temperatures ... E118
Iron thermal conductivity of ... E10
I.R. charts—infrared correlation charts ... F168
Isobars, definition ... F82
Isobutane, thermodynamic properties of ... E25
Isomerism, definition ... E84
Isomorphs, cubic, x-ray diffraction data ... E192
Isothermal compressibility of liquids ... F12
Isothermal, definition ... F82
Isotopes, definition ... F82
Isotopes, table of the ... B4
Isotopes, thermal neutron cross sections ... B93

J

Jena glasses, transmission of colored ... E233
Joule, unit of work, definition ... F82; F102
Joule-Thomson effect ... F82
Just or scientific scale ... E39

K

K_a values of organic bases in aqueous solution ... D87
K_b of inorganic bases in aqueous solution ... D89
K and L x-ray absorption edges ... E188
Kelvin degree, definition ... F102
Kelvin scale, definition ... F95
Kelvin temperatures, reciprocals of ... F238

PAGE
Kepler's law ... F83
Kerr effect, definition ... F83
Ketosamines, physical characteristics of ... C707
Ketoses and aldoses, physical characteristics of ... C707
Key to explanation of physical properties of organic compounds table ... C53
Kilogram (unit of mass), definition ... F102
Kinematic, viscosity conversion ... F34
Kinematic viscosity, definition ... F98
Kinetic energy, definition ... F76
Kinetic energy of rotation, equation ... F76
Kinetic friction, various materials, coefficient of ... F15
Kinetic theory, expression for pressure ... F83
Kinetic theory of gases, definition ... F83
Kirchhoff's laws of radiation ... F83
Knoop and Mohs scales, comparison of hardness values of various materials ... F18
Knot, International ... A10
Kohlrausch's law ... F83
Krypton 86, wave length of orange-red line of ... A10
Kundt's law ... F83

L

Laboratory reagents for general use ... D60
Laboratory reagents preparation of ... D60
Lambda point of He(Helium) ... D103
Lambert, definition ... E196
Lambert, unit of brightness, definition ... F83
Lambert's law of absorption ... F83
Lambert's law of illumination ... F83
Langevin function £(u), values for ... E112
Lanthanide series (lanthanides) ... F83
Laplace operations, table ... A234
Laplace transforms and operations, explanation of ... A234
Laplace transforms and operations, table ... A234
Laplace transforms, table ... A234
Latent heat of fusion, definition ... F80
Latent heat of vaporization, definition ... F83
Latitude, degree of ... A10
Latitude factor, reduction of barometer to sea level ... E33
Latitude, longitude and elevation due to gravity ... F144
Lattice energies of the alkali halides ... F165
Lattice energy, definition ... F83
Laws, chemical, definitions ... F65
Lead wire materials, physical properties of ... F138
Least mechanical equivalent of light, definition ... E196
Least squares, formulas ... A254
Least time, Fermat's principle of, definition ... F78
LeChatelier's principle ... F83
Length of seconds pendulum ... F144
Lengths of seconds pendulum at sea level ... A10
Length, units of, definition ... F83
Lengths, bond, between carbon and other elements ... F154
Lengths bond of elements ... F154
Lenses, equations ... F83
Lenz' law ... F84
Leptons, elementary particles ... F188
Light, efficiency of a source of, definition ... E196
Light, Huygens theory of, definition ... F81
Light, incandescent, reflection coefficients of surfaces for ... E227
Light, least mechanical equivalent of ... E196
Light, red cadmium, in air at 15°C, 760 mm pressure, absolute wave length of ... A10
Light sources, various, approximate brightness of ... E196
Light, velocity of ... F166
Light, velocity of in vacuum ... A10; E197
Limits of inflammability of gases and vapors in air ... D57
Limits of inflammability of gases and vapors in oxygen ... D58
Linear factors, non-repeated, formula ... A246
Linear factors, repeated, formula ... A246
Line of force, definition ... F84
Lines and bands, wave lengths of, for Flame Spectra ... E198
Liquid, definition ... F84
Liquid elements, surface tension of ... F19
Liquid parahydrogen, dielectric constant of ... E65
Liquids, certain, thermal conductivity of ... E11
Liquids density of ... F3
Liquids, elements, vapor pressure of ... D142
Liquids for index of refraction by immersion method ... E219
Liquids, heavy, for mineral separation ... E219
Liquids, isothermal compressibility of ... F12
Liquids, pure, inorganic, organic, dielectric constants of ... E58
Liquids, velocity of sound in ... E38
Liquids, viscosity of ... F37
Lissajous figures, definition ... F84
Lithium metals, electrical resistivity of ... F141
$Log_{10}x$, conversion to RT $log_e x$, conversion factors for ... F237
Logarithmic constants ... A9
Logarithmic forms, Integrals ... A217
Logarithmic formulas, algebraic, series ... A239
Logarithms, change of base of, equation ... A9
Logarithms, explanation of use ... A1
Logarithms, four-place, five-place of the trigonometric functions, use of table ... A4
Logarithms, naperian or natural, 0 to 999 ... A95
Logarithms, natural, use of table ... A6
Logarithms of decimal fractions, four-place ... A14
Logarithms of gravimetric factors ... B266
Logarithms of reciprocals of gravimetric factors ... B266
Logarithms of the functions, trigonometric table ... A40
Logarithms of the trigonometric functions for angles in degrees, minutes and seconds ... A40
Logarithms of the trigonometric functions for angles in radians ... A92
Logarithms of the trigonometric functions, table ... A40
Logarithms of the trigonometric functions for angles in degrees and decimals, table ... A89
Logarithms of the trigonometric functions use of table ... A4
Logarithms, five-place, table ... A18
Logarithms, four-place, table ... A12
Loschmidt's number, definition and value of ... F84
Loudness, definition ... F84
Low boiling elements, boiling and triple points of ... D103
Lowering of vapor pressure by salts in aqueous solutions ... E1
Low melting point alloys ... F18
Low melting point solders ... F141
Low melting solders, nominal composition of ... F141
Low temperature total emissivities ... E227
Lumen, definition ... E196
Lumen, unit of luminous flux, definition ... F84; F102
Luminous flux, lumen, definition ... F84; F102
Luminous intensity, Candela, definition ... F82; F101
Lune, area of, formula ... A258
Lux, unit of illumination, definition ... F81

M

MacLaurin's formulas, algebraic, series ... A248
Magnet, couple acting on, equations ... F72
Magnet, magnetic field due to equations ... F84
Magnetic alloys, cast permanent ... E115
Magnetic alloys high permeability of ... E114
Magnetic anisotrophy, definition ... F102
Magnetic dipoles, Langevin function ... E112
Magnetic domains, definition ... F102
Magnetic field due to a current, equations ... F84
Magnetic field due to a magnet, equations ... F84
Magnetic field intensity, definition ... F84
Magnetic flux, definition ... F85; F102
Magnetic induction, definition, equations ... F85
Magnetic line of force, definition ... F84
Magnetic materials—high permeability ... E118
Magnetic materials—permanent magnet alloys ... E118
Magnetic materials—property of antiferromagnetic compounds ... E117
Magnetic moment, definition, equation ... F85
Magnetic permeability, definition ... F85
Magnetic pole, definition ... F85
Magnetic poles, force between two equations ... F85
Magnetic potential, definition ... F85
Magnetic properties of transformer steels ... E118
Magnetic properties and composition of some permanent magnetic alloys ... E113
Magnetic reluctance, definition ... F91
Magnetic resonance frequencies, moments and nuclear spins ... E72
Magnetic rotatory power, table ... E249
Magnetic substances, saturation constants for ... E118
Magnetic susceptibilities of organic compounds ... E124
Magnetic susceptibility, definition ... F95
Magnetic susceptibility, of the elements and inorganic compounds ... E119
Magnetism and electricity ... E58
Magnetism, intensity of, definition ... F82
Magnetism, quantity of, definition ... F85
Magnetism, surface density of, definition ... F95
Magnetomotive force, definition ... F85
Magnetostriction, definition ... F101
Magnets, action of one on another, equations ... F96
Magnets, composition and properties of some permanent magnetic alloys ... E81
Magnifying power, definition ... F85
Maltose hydrate solutions index of refraction ... E225
Manganin, thermal conductivity of ... E10
Manufacturers, trade names and composition of some plastics ... C719
Mass absorption coefficients for X and gamma rays ... E133
Mass absorption, definition ... F65
Mass action, law of ... F85

Mass by weighing on a balance with unequal arms, equation....F85
Mass defect, definition....F85
Mass definition....F85
Mass energy equivalence, definition....F85
Mass of hydrogen atom....A10
Mass transfer, dimensionless groups for....F262
Mass, units of, definition....F85
Materials, Cellular Gypsum, thermal conductivity of....E5
Materials, loose, thermal conductivity of....E5
Materials, magnetic, property of antiferromagnetic compounds..E117
Materials, miscellaneous building materials, thermal conductivity of....E5
Materials, semi-flexible, in sheet form, thermal conductivity of....E5
Materials, semi-rigid, in board form, thermal conductivity of....E5
Materials, stiff fibrous, in sheet form, thermal conductivity of....E5
Materials, superconductive....E81
Materials, velocity of sound in....E38
Materials, woods (across grain) thermal conductivity of....E5
Mathematical symbols recommended for physics....F203
Mathematical Tables....A1
Mathematical Tables, use of....A1
Matrix calculus, recommended symbols for....F205
Maximum work, Berthelot's principle of....F69
Maxwell, definition....F85
Maxwell, unit of magnetic flux, definition....F85
Maxwell's rule....F85
Mean density of the earth....A10
Mean free path in the earth's atmosphere at elevations up to 160 kilometers....F145
Mean free path of gas molecules....F151
Mean free path vs. altitude, graph....F150
Mean molecular weight vs. altitude, graph....F149
Mean particle speed vs. altitude, graph....F151
Measures and weights, abbreviations of common units....F213
Measures of dispersion and skewness....A253
Mechanical and physical properties of whiskers....F59
Mechanical equivalent of heat, definition....F86
Mechanical equivalent of light, least, definition....E196
Megabarye, unit of pressure, definition....F90
Melting and boiling points of the elements....D103
Melting and boiling points of inorganic compounds....B172
Melting point alloys, low....F18
Melting point alloys mixtures of metals....D102
Melting point alloys organic compounds, index....C631
Melting points of various alloys....D102
Mensuration formulas....A256
Mercury, density and specific volume of....F6
Mercury, density of, at 0°C....A10
Mercury, heat capacity of....D95
Mercury, thermodynamic properties of....E27
Mercury, vapor pressure of....D111
Meson, definition....F86
Mesons, elementary particles....F188
Metallic elements, definition....F86
Metals as conductors, properties of....E80
Metals, brazing, filler (solders)....F142
Metals, elements, vapor pressure of....D142
Metals, diffusion of, into metals....F55
Metals, electrical resistance....E80
Metals, liquid, surface tension of....F19
Metals, melting point of mixtures of....D102
Metals, self diffusion of tracers in....F48
Metals, static friction, coefficient of....F15
Metals thermal conductivity of certain....E10
Meteorological and atmospheric data....F145
Meter, unit of length, definition....F83; F102
Method of mixtures in calorimetry, equation....F93
Methyl alcohol, surface tension of....F29
Methyl chloride, thermodynamic properties of....E27
Metric table of the U.S. extension of the ICAO standard atmosphere, abbreviated....F148
Mev, definition....F86
Mho, unit of conductance, definition....F71
Microcosmic salt bead tests....D59
Micron....A10
Mile, international nautical....A10
Miles, (statute), conversion tables....A8
Mils-radians-degrees....A117
Mineral separation, heavy liquids for....E219
Minerals, molar volumes and densities of....B308
Minerals, physical constants of....B301
Minerals, rules for naming....B171
Minerals, X-ray crystallographic data....B308
Minimum deviation, definition, equation....F86
Minutes and seconds to decimal parts of a degree, conversion table....A123
Minutes to radians, conversion table....A118
Mirrors, spherical, equations....F94
PAGE
Miscellaneous physical constants....A10
Miscellaneous π and e Constants....A9
Miscellaneous properties of common refrigerants....E28
Miscellaneous relations, trigonometric....A262
Miscellaneous symbols....F191
Miscibility of organic solvent pairs....C687
Mixtures, definition....F86
Mixtures, method of, in calorimetry, equations....F93
Mixtures of metals, melting point of....D102
MKSA system of units....F208
Mode of decay of the Isotopes....B4
Moderator, definition....F86
Moduli, elastic, equations....F75
Modulus of elasticity, dimensionless groups for....F262
Modulus of rigidity, equation....F75
Modulus, Young's equations....F75; F86
Moen and Washburn wire gauge....F129
Mohs' scale of hardness....F18
Moist air, density of, tables....F9
Molality, conversion to molarity....D85
Molality of aqueous solutions....D143
Molal solution, definition....F86
Molar, definition....F86
Molar, fraction, conversion to molarity and molality....D85
Molar refraction of organic compounds, formula for calculation of....E223
Molar solution, definition....F86
Molar volumes and densities of some elements and minerals....B308
Molarity, conversion to molality and mole fraction....D85
Molarity of aqueous solutions....D143
Molarity of some concentrated inorganic acids and bases....D92
Mole, fraction, conversion to molarity and molality....D85
Molecular constants of gases....F146
Molecular depression of the freezing point....D104
Molecular elevation of the boiling point....D104
Molecular spectroscopy, recommended symbols for....F202
Molecular volume, definition....F86
Molecular weight, definition....F86
Molecular weight inorganic compounds....B172
Molecular weight, organic compounds....C75
Molecule, definition....F86
Molecules, bond strengths in diatomic....F158
Molecules, bond strengths in polyatomic....F163
Molecules, dipole moments of, in gas phase....E66
Moment of force or torque, definition, equation....F86
Moment of inertia, definition....F86
Moment of momentum, angular, definition, equation....F86
Moments and spins, nuclear....E72
Momentum, definition, equation....F86
Momentum transfer, dimensionless groups for....F262
Monochromatic emissive power, definition....F86
Monocyclic Hydrocarbons, rules for naming....C8
Monosaccharides, natural, physical characteristics of....C707
Monotropic, definition....F86
Moon, constant of sine parallax for....F166
Mosley's law....F86
Motion, laws of....F87
M-Tiles, formula....A253
Multiple angles, trigonometric functions of....A261
Multiple proportions, law of....F87
Multiples and fractions of π radians in degrees....A122
Multiples of $\frac{\pi}{2}$....A11
Musical scales, standard and International pitch....E39
Mutual inductance, definition....F82

N

Na-K, physical properties of....F58
Names and dyestuff intermediates....C716
Naperian or natural logarithms, 0 to 999....A95
Napier's rules for right spherical triangles....A263
National Academy of Sciences publication dealing with sources of critical data....F275
National Bureau of Standards approved symbols for certain units..F192
National Bureau of Standards recommended abbreviations for common units and measures....F213
Natural abundance of the Isotopes, table....B4
Natural aldonic, aldaric and uronic acids, physical characteristics of....C707
Natural functions for angles in π radians....A93
Natural functions for angles in π radians....A91
Natural functions, trigonometric, table....A63
Natural logarithms, base of....A9
Natural logarithms, use of table....A6
Natural or Naperian logarithms, 0 to 999....A95
Natural trigonometric functions....A63
Natural trigonometric functions for angles in degrees and decimals, table....A87

Natural trigonometric functions for angles in radians....A91
Natural trigonometric functions, use of table....A5
Nautical international mile....A10
Neel point, definition....F103
Negatron, definition....F87
Nernst effect....F87
Neutralization, definition....F87
Neutrino, definition....F87
Neutron cross section, definition....F87
Neutron cross section, thermal....B93
Neutron, definition....F87
n-Fission neutrons produced per thermal neutron absorbed....B93
Newton (unit of force), definition....F87; F103
Newton's formula....A252
Newton's law of cooling....F87
Newton's law of motion....F87
Nitric acid, vapor pressure of....D141
Nitrides, refractory materials....D29
Nitrogen, gaseous, thermal conductivity of....E3
Nitrogen, liquid, thermal conductivity of....E11
NMR characteristic spectral positions for hydrogen in organic structures....F187
Nodal points, definition....F87
Nomenclature for dimensionless groups....F263
Nomenclature of inorganic chemistry....B148
Nomenclature used in physics....F195
Non-conductors, definition....F73
Non-metallic elements, definition....F86
Non-metals, static friction, coefficient of....F15
Noon sunlight, filter for....E247
Normal curve of error, areas, ordinates and derivatives of, table....A157
Normal curve of error, explanation of....A7
Normal salt, definition....F87
Normal solution, definition....F87
Nuclear atom, definition....F87
Nuclear fusion, definition....F87
Nuclear isomers, definition....F87
Nuclear magnetic resonance data....E72
Nuclear spins, moments, and magnetic resonance frequencies....E72
Nucleon, definition....F87
Nucleus, definition....F87
Nuclide, definition....F87
Nuclides, recommended symbols for....F195
Number, Avogadro's....A10
Numbers, Bernoulli....A249
Numbers containing π constants....A9
Numbers, Euler....A249
Numbers, exponential method of expressing numbers....A1
Numbers, powers of, 4th to 8th inclusive....A154
Numbers, powers of, use of table....A7
Numbers, reciprocals of....F238
Numerical aperture of an objective, definition....F87
Numerical constants....A9
Numerical relations, special....A251
Numerical tables....A124
Numerical tables, reciprocals, circumference and area of circles....A124
Numerical tables, use of....A6
Nusselt number and other dimensionless groups....F262

O

Oblate spheroid, surface and volume, formulas....A258
Observer, standard....E247
Occurrence of the elements....B97
Oersted, definition....F87
Oersted, unit of magnetic field intensity....F84
Ohm, unit of electric resistance, definition....F88; F103
Ohm's law, equation....F88
Oils, plant and animal, physical and chemical characteristics of....D190
Opacity, definition....F88
Opaque pigments, properties of....F60
Operational definition of pH....D78
Operations and transforms, Laplace, explanation of....A234
Operations, Laplace, table....A234
Optical density, transparency to, conversion table....E251
Optical rotation of acids and bases....E248
Optical rotation of certain sugars....C707
Optic axes of minerals, angles of....B301
Orbits, interplanetary, Tables A and B....F146
Organic acids, dissociation constants of, in aqueous solutions....D90
Organic analytical reagents....D71
Organic bases, dissociation of, in aqueous solutions....D87
Organic chemical compounds, bond lengths and angles of....F156
Organic compounds, abbreviations and symbols used in Table of Physical Constants, list of....C74
Organic compounds boiling point index....C643
Organic compounds, diamagnetic susceptibilities....E124
Organic compounds, explanation of table....C53

Organic compounds, formula for calculation of molar refraction....E223
Organic compounds formula index....C602
Organic compounds, heat capacity of some....D96
Organic compounds, heat of combustion of....D184
Organic compounds, heat of formation for....D189
Organic compounds, index of refraction....E221
Organic compounds in organic solvents, surface tension of....F29
Organic compounds in water, surface tension of....F28
Organic compounds, magnetic susceptibilities of....E124
Organic compounds melting point index....C631
Organic compounds, physical constants of....C75
Organic compounds, prefix, names of....C46
Organic compounds, rules for naming of....C1
Organic compounds, sublimation data....C686
Organic compounds supplementary table....E130
Organic compounds, symbols and abbreviations used in Table of Physical Constants, list of....C74
Organic compounds, thermal conductivity of....E4
Organic compounds, vapor pressure citations....D136
Organic compounds, vapor pressure greater than one atmosphere....D137
Organic compounds, vapor pressure less than one atmosphere....D120
Organic compounds, vapor pressure, variation with temperature....D139
Organic industrial solvent pairs, miscibility of....C687
Organic liquids, dielectric constants of....E58
Organic molecules, bond strength of some....F165
Organic radicals, prefix names of....C46
Organic ring compounds, names and numbering....C50
Organic structures, characteristics NMR spectral positions for hydrogen in....F187
Organometallic compounds, physical constants of....C650
Organ pipes, frequency of, equations....F88
Oscillatory motion, definition....F88
Osmosity of aqueous solutions....D143
Oxidation, definition....F88
Oxidation, reagents, equivalent weight of various....D70
Oxide, deuterium, dielectric constant of....E64
Oxides, heat of formation of inorganic....D22
Oxides, heat of transition of....D35
Oxides, refractory materials....D29
Oxides, spectral emissivity of....E228
Oxides, thermodynamic properties....D35
Oxygen and ozone, physical constants of....F57
Ozone and oxygen, physical constants of....F57

P

Packing fraction, definition....F88
Parabola, area of section, formula....A257
Parabola, equations of....A264
Parabola, length of arc of, formula....A257
Parahydrogen, liquid, dielectric constant of....E65
Parallelogram, area of, formula....A256
Paramagnetic materials, definition....F88; F103
Partial fractions....A246
Particles, elementary, data....F188
Pascal's law....F88
Peltier effect, definition....F88
Pendulum, acceleration due to gravity and length of seconds....F144
Pendulum, equations....F88
Pendulum, seconds, length of....F144
Pendulum, seconds, length of at sea level....A10
Percent composition of aqueous solutions....D143
Perimeter of a polygon, circumscribed about a circle, formula....A256
Perimeter of a polygon inscribed in a circle, formula....A256
Perimeter of geometric figures, formulas....A256
Period, definition....F88
Periodic chart of the elements, table....B3; back inside cover
Periodic law....F88
Permanent magnetic alloys....E119
Permeability initial, of high purity iron for various temperatures....E118
Permeability of magnetic materials, high....E118
Permeance, definition....F88
Permutations, formulas....A245
Persistent spectrum lines of the elements, arranged by elements....E209
Persistent spectrum lines of the elements, arranged by wavelengths....E209
pH of natural media and its relation to the precipitation of hydroxides....F145
pH, operational definition of....D78
pH, properties of standard aqueous solutions at 25°C....D78
pH values of amino acids....C703
pH values of solutions at 25°C....D80
pH values of standard solutions from 0–95°C....D80
Phase of oscillatory motion, definition....F88
Phase rule, Gibbs' definition....F79
Phot, unit of illumination, definition....F81
Photographic density, equation....F88
Photometric quantities, units and standards....E196

Relative humidity, dew-point....E35
Relative humidity from wet and dry thermometer readings....E36
Relative visibility, definition....E196
Reluctance, definition....F91
Reductivity, definition....F91
Resistance, aluminum wire, B. and S. gauge....F133
Resistance, conductors in series and parallel, equations....F91
Resistance, copper wire, B. and S. gauge....F131
Resistance, definition....F91
Resistance, specific (resistivity)....F92
Resistance, temperature coefficient, definition....F95
Resistance, wires per unit length of....F135
Resistivity, electrical, of elements....F140
Resistivity, electrical, of metals....E80
Resistors, color code marking for composition type and wire wound type....F137
Resolving power, definition....F92
Resonance, chemical, definition....F92
Resonance frequencies, magnetic....E72
Restitution, coefficient of, definition....F92
Restitution, coefficient of, equation....F75
Reversible reaction, definition....F92
Reversion of series....A247
Reynolds number and other dimensionless groups....F262
Rheological and elastic properties, dimensionless groups for....F262
Rhombus, area of, formula....A256
Right-angled triangle, trigonometric functions for....A261
Right-spherical triangles, Napier's rules for....A263
Rigidity, modulus of, equations....F75; F83
Ring compounds, organic, names and numbering....C50
Rock salt, index of refraction....E223
Rock salt, sylvine and fluorite transparency for the infra-red transmissibility for....E246
Rocks, chemical composition of....F144
Roentgen, definition....F92
Roots and powers, formulas....A244
Roots, squares and cubes, numerical tables of....A134
Rotation, polar axes through angle ϕ....A265
Rotation, specific, amino acids....C704
Rotation, specific, table....E248
Rotatory power, equation....F92
Rotatory power, magnetic....E249
RT $\log_e x$, conversion from $\log_{10} x$, factors for....F237
Rubidium metals, electrical resistivity of....F141
Rule numbers, index, organic compounds....C44
Rules for naming inorganic compounds....B148
Rules for naming organic compounds....C1
Rules for symbols, units and nomenclature in physics....F193
Russian and Greek Alphabet....F210
Rydberg constant, definition....F92
Rydberg formula, equation....F92

S

Safe carrying capacities for copper and aluminum wire....F131
Salt, definition....F92
Salt solutions, humidity of saturated....E37
Salts, acids and bases, activity coefficients of....D93
Salts, inorganic, rules for naming....B148
Salts, inorganic, solubility of in water and acid (for qualitative analysis)....D76
Satellite geodesy, constants for....F166
Saturated aqueous vapor, weight in grams of a cubic meter....E32
Saturated solution, definition....F93
Saturated steam, properties of....E12
Saturation constants and curie points of Ferromagnetic elements....E117
Saturation constants for magnetic substances....E118
Scalar, dot, or inner product of two vectors V_1 and V_2....A250
Scale, musical, scientific or just....E39
Scales, musical standard and International pitch....E39
Scattering cross sections, thermal neutron....B93
Scientific and engineering terms, abbreviations for....F211
Scientific or just musical scale....E39
Scintillometer, definition....F92
Sea level, acceleration due to gravity at....A10
Sea level atmospheric composition for a dry atmosphere....F147
Sea level, length of seconds pendulum at....A10
Sea level values of ICAO atmosphere....F147
Sea water, elements present in solution, excluding dissolved gases....F145
Second, ephemeris, unit of time, definition....F95; F101
Secondary electron emission....E216

Seconds pendulum at sea level, length of....A10
Seconds pendulum, length of....F144
Seconds to radians, conversion table....A118
Sector of a circle, area of, formula....A257
Sector of an annulus, area of, formula....A257
Seebeck effect, definition and formula....F92
Segment of a circle, area of, formulas....A257
Seismic waves, velocity of....F145
Self-induction, definition....F82
Semiconductors, properties of....F97
Sensitiveness of a balance, equation....F92
Series, algebraic, binomial....A247
Series, algebraic, exponential....A248
Series, algebraic, Fourier....A248
Series, algebraic, logarithmic....A248
Series, algebraic, MacLaurin's....A248
Series, algebraic, reversion of....A247
Series, algebraic, Taylor's....A248
Series, algebraic, trigonometric....A248
Series, formula for resistances of conductors in....F91
Sheet metal gauge....F129
Shell, definition....F92
Sheppard's corrections, formulas....A254
Signs and limits of value of the trigonometric functions....A259
Silica, vitreous, thermal conductivity of....E6
Silicides, refractory materials....D30
Silicon transformer steel, high....E118
Silver, electrochemical equivalent of....A10
Silver, thermal conductivity of....E10
Simple correlation....A254
Simple harmonic motion, definition, equations....F92
Simple machine, definition, equations....F93
Simpson's rule for irregular areas....A259
Sine, cosine, and exponential integrals....A233
Sine, finite transforms, Fourier table....A236
Skewness and dispersion, measures of....A253
Skewness, formulas....A263
Snell's law of refraction, definition....F93
Sodium carbonate bead test....D59
Sodium metals, electrical resistivity of....F141
Sodium-Potassium (na-K), physical properties of....F58
Sodium, physical properties of....F58
Sodium, viscosity of liquid....F59
Solar constant....F151
Solar radiation, coefficient of absorption of....E227
Solar system data....F145
Solders....F142
Solders, low melting point....F141
Solid analytical geometry....A265
Solid angle, definition....F93
Solid, definition....F93
Solids, bounded by curved surfaces, formulas....A258
Solids, bounded by planes, formulas....A258
Solids, dielectric constants of....E58
Solids, elements, vapor pressure of....D142
Solids, metallic, diffusion of metals into solids....F55
Solids, technical, specific heat and enthalpy of, at low temperatures....D99
Solids, various, density of....F1
Solids, velocity of sound in....E38
Solubilities of the amino acids in grams per 100 grams of organic solvent....C705
Solubilities of the amino acids in water....C705
Solubilities of the amino acids in water-ethanol mixtures....C705
Solubility chart....D76
Solubility, definition....F93
Solubility of inorganic compounds....B172
Solubility of organic compounds....C75
Solubility product, definition....F93
Solubility product, table....B307
Solute, definition....F93
Solute elements, diffusion of, in body centered cubic titanium and titanium alloys....F56
Solution, deci-normal, of various salts and reagents....D68
Solution, electrolytic, tension theory....F76
Solution, heats of, of uni-univalent electrolytes....D58
Solution, saturated, definition....F93
Solution tension theory, electrolytic....F76
Solution, true, definition....F93
Solutions, conversion formulas for those having concentrations expressed in various ways....D85
Solutions giving round values of pH at 25°C....D79
Solutions, special, reagents....D62
Solvent, definition....F93
Solvents, industrial pairs, miscibility of organic....C687

ATOMIC WEIGHTS

For the sake of completeness all known elements are included in the list. Several of those more recently discovered are represented only by the unstable isotopes. The value in parenthesis in the atomic weight column is, in each case, the mass number of the most stable isotope.**

Name	Symbol	At. No.	International atomic weight		Valence
			1966	1959	
Actinium	Ac	89	.....	(227)	.....
Aluminum	Al	13	26.9815	26.98	3
Americium	Am	95	.....	(243)	3, 4, 5, 6

1. ±0.002
2. ±0.001
3. ±0.001

* Because of natural variations in the relative abundances of the isotopes of sulfur the atomic weight of this element has a range of ±0.003.

** The 1959 atomic weights are based on O = 16.000 whereas those of 1966 are based on the isotope C^{12}.
